TWP-ICE NWP Intercomparison: Dry Intrusion and Resolution Impact

Yanluan Lin and NWP group ASR meeting Mar 15 2010

Participating models and related physics

Table 1: Participating Models

Name	Deep Convection	Shallow Convection	PBL	LS CLoud
IFS(Cy35r3)	Betchold	EDMF	EDMF	Tiedtke with Tompkins subgrid
CAM4	ZM95(Neale)	Bretherton-Park	$\mathbf{U}\mathbf{W}$	Morrison Gettleman
AM2	RAS	RAS	Lock	Tiedtke-Rotstayn-Klein
AM3P5	Donner	UW	Lock	Tiedtke-Rotstayn-Klein-Ming
HIRAM	\mathbf{UW}	UW	Lock	Tiedtke-Rotstayn-Klein-Zhao
UKMO	GR-Martin	GR-Martin	Lock	Smith(1990), Wilson-Ballard(1999)
$\operatorname{GSM}(\operatorname{JMA})$	AS	AS	MY level-2	Prognostic qv, diagnosed qa
GME(GWS)	Tiedtke 1989)	$\operatorname{Tiedtke}(1989)$	MY level-2	Kessler type BMP
IAP(China)	ZM95	Hack94	Holtslag-Boville-nonlocal	Morrison Gettleman

Model forecast setup

- Initialized from ECMWF reanalysis at 00Z each day
- No nudging
- Land spinup
- Day 2 forecast (f24-f45) at 3-h interval is used

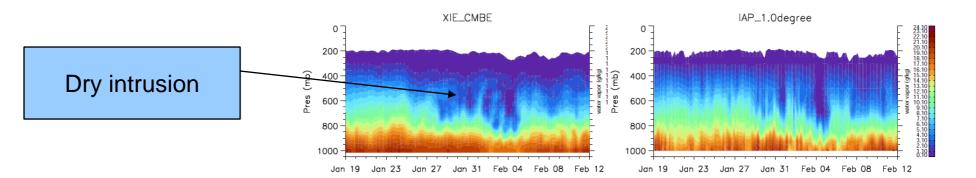

A trend of merged climate model and global forecast model (UKMO, EC-earth, JMA?)

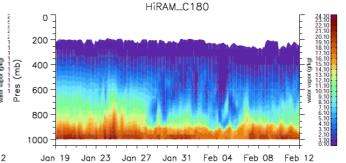

What do we have?

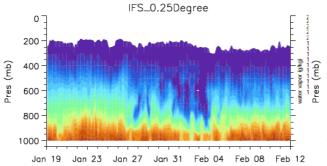

3-hourly model outputs over a large domain

(25S to 0, 121-141) to check synoptic evolution

- Various observations (prep, cloud, surface fluxes, radiation, etc.)
- Standard plots (time-height plot, time series, vertical profiles, composite plots) are prepared.(do we need to post all these plots on a web page for easy comparison?)

Preliminary conclusions

- Dry air intrusion is the reason for the suppressed convection from 1/26-2/2. Model cloud fraction and convection are closely related with the simulated dry air intrusion.
- Convective precipitation ratio generally decreases with resolution, but it also depends on synoptic regimes and models.
- Composite analysis help identify model cloud and precipitation characteristics.

Can we go one step further beyond just describing the model difference?

- How to relate model results to model physics, especially for cloud and precipitation?
- How does resolution impact cloud and precipitation simulations?
- Can we identify any systematic bias, such as diurnal cycle, convection triggering, and vertical heating profiles, etc.?
- Any useful analysis to detect relationships at mechanism levels, like some physically meaningful conceptual variables?

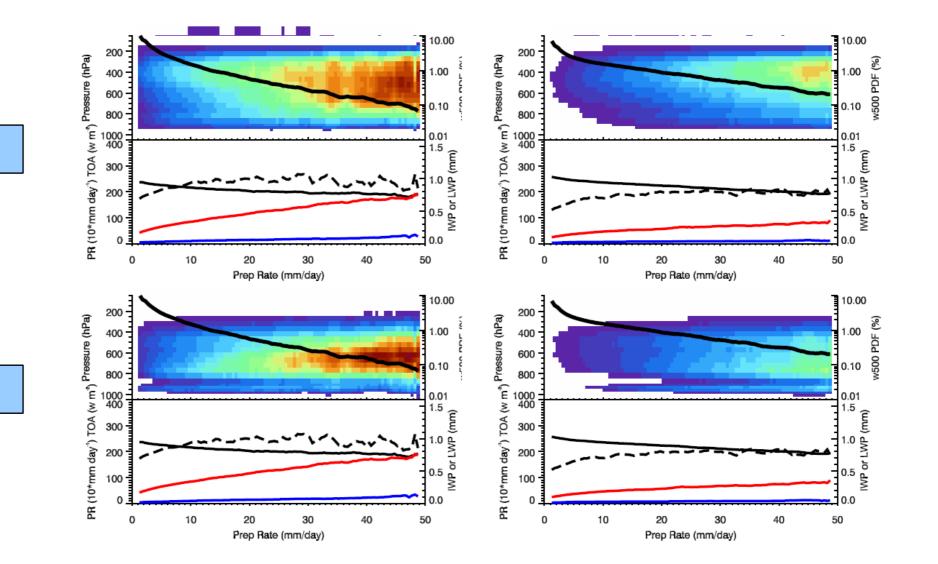

Future work

- Determine the theme of the manuscript and prepare the first draft.
- Have comments and suggestions from each participants.

Questions and comments

- What is the realistic partition between convective and LS precipitation over the tropics?
- How do model cloud microphysics, macrophysics, convective parameterization, and PBL schemes interact to affect the model cloud and precipitation?
