

# Combining 'apples' and 'oranges' in near cloud observations

A. Marshak (NASA GSFC),

T. Varnai (JCET), W. Yang, P. McBride (GESTAR),

## Twohy et al. (2009)

*estimated that "the aerosol direct radiative effect as derived from satellite observations of cloud-free oceans to be 35-65% larger than that inferred for large (>20 km) cloud-free ocean regions."*

## Chand et al. (2012)

*found a 25% enhancement in AOT between CF 0.1-0.2 and CF 0.8-0.9. This "enhancement is consistent with aerosol hygroscopic growth in the humid environment surrounding clouds."*

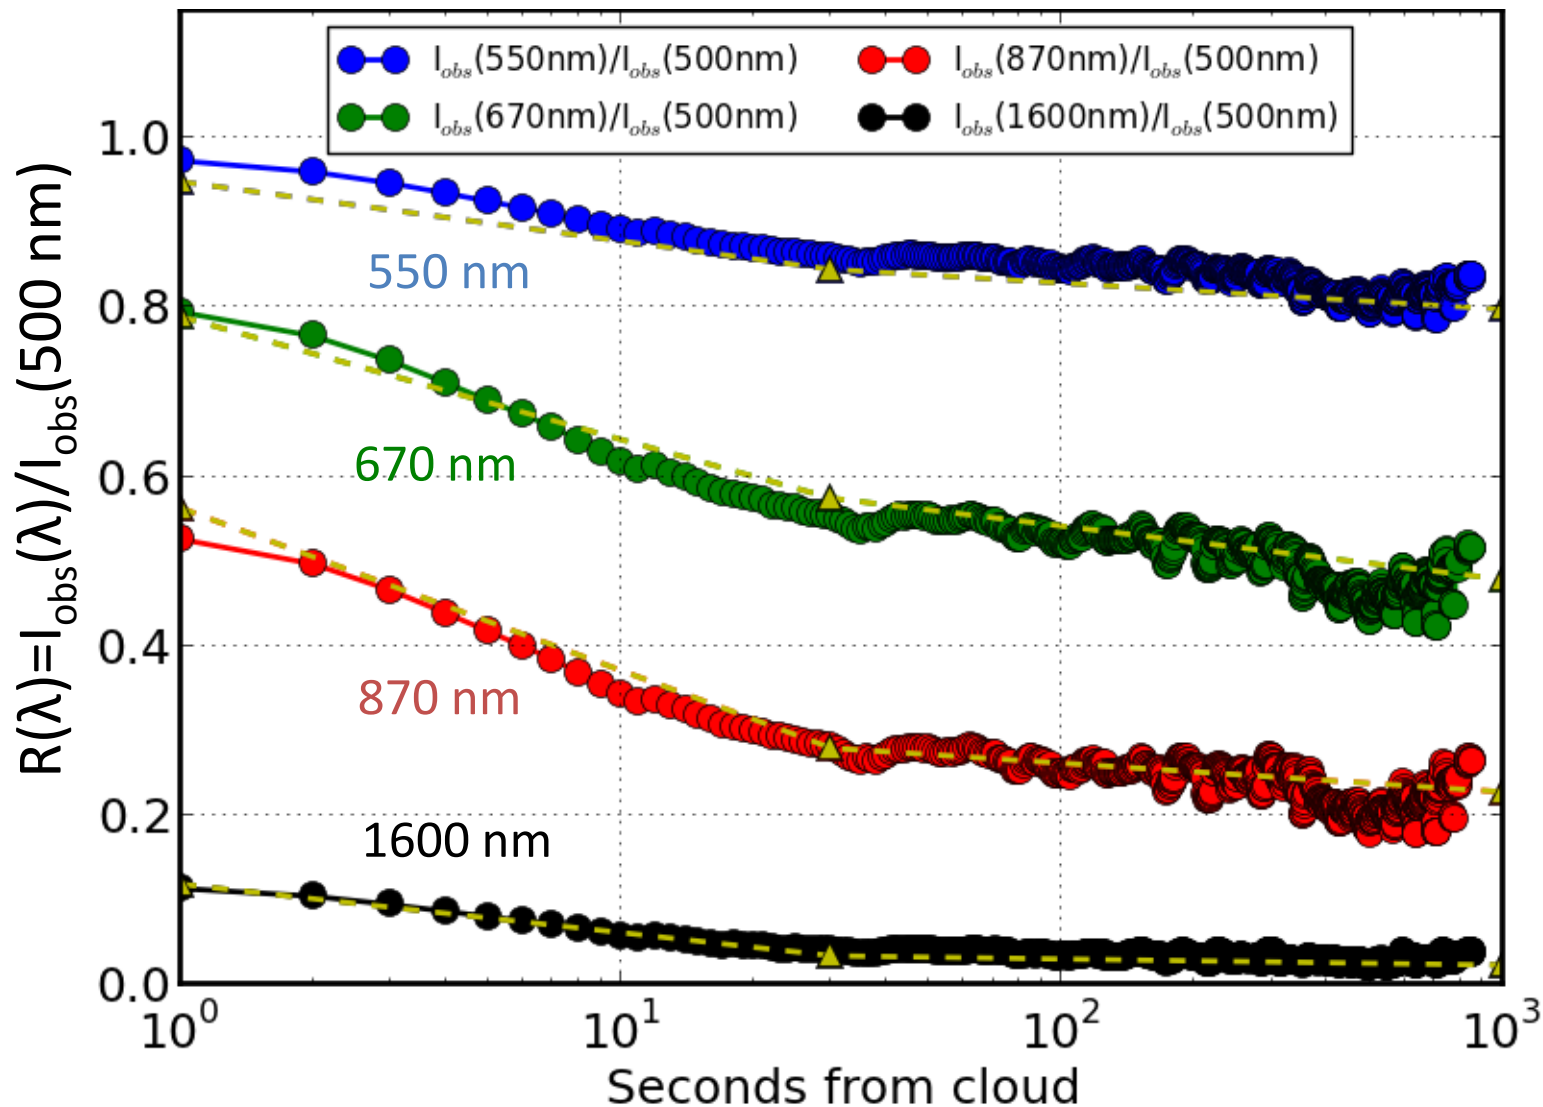

# Relative enhancement

Varnai et al., 2013

The same MODIS cloud mask has been used

# ARM SWS

Measured radiance ratios from 7 months and 208 cases;  $\mu_0=0.6-0.7$ .

# The enhancement of observed radiation near clouds is mainly due to

- Humidification of aerosols near clouds;
- Small cloud contamination;
- 3D RT effects
- What's about sampling issues due to different large-scale meteorological conditions???

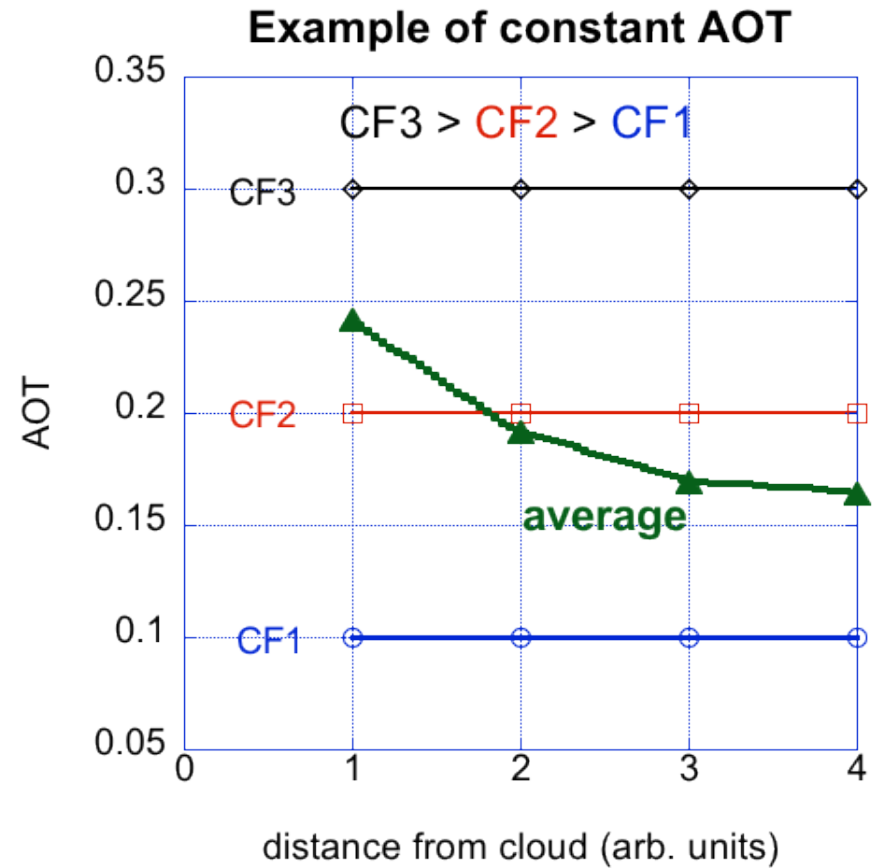

# Large-scale meteorology

The clear pixels within a few km of clouds are under partly cloudy conditions, while the clear pixels 10-20 km away from clouds are under large-scale high pressure conditions.

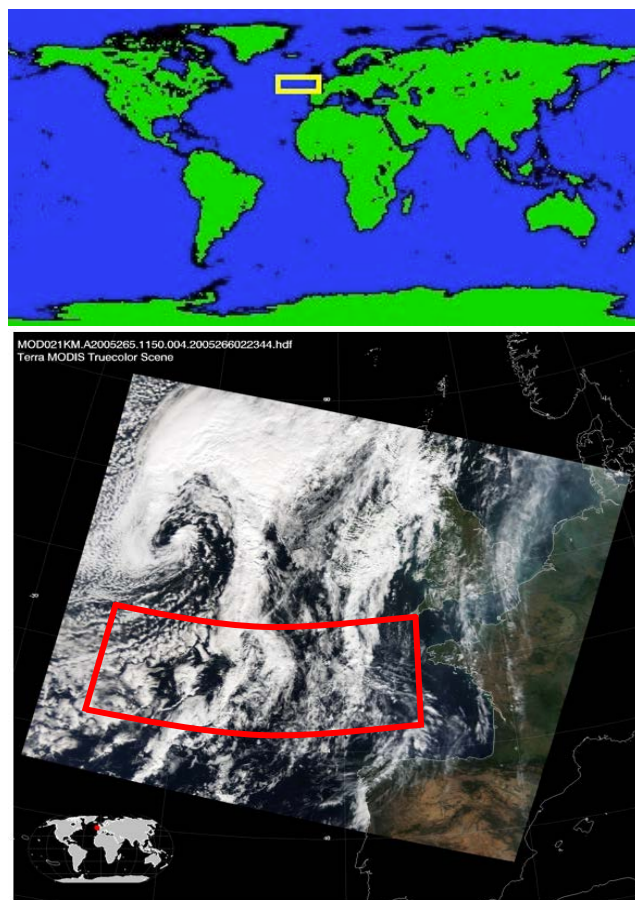

The weather patterns and circulations for these two cases can be very different and the AOT and size can be different.

Relative humidity under these two cases is also different: higher under partly cloudy conditions than under large-scale clear conditions.

# What's about 'apples' and 'oranges' or a sampling issue?

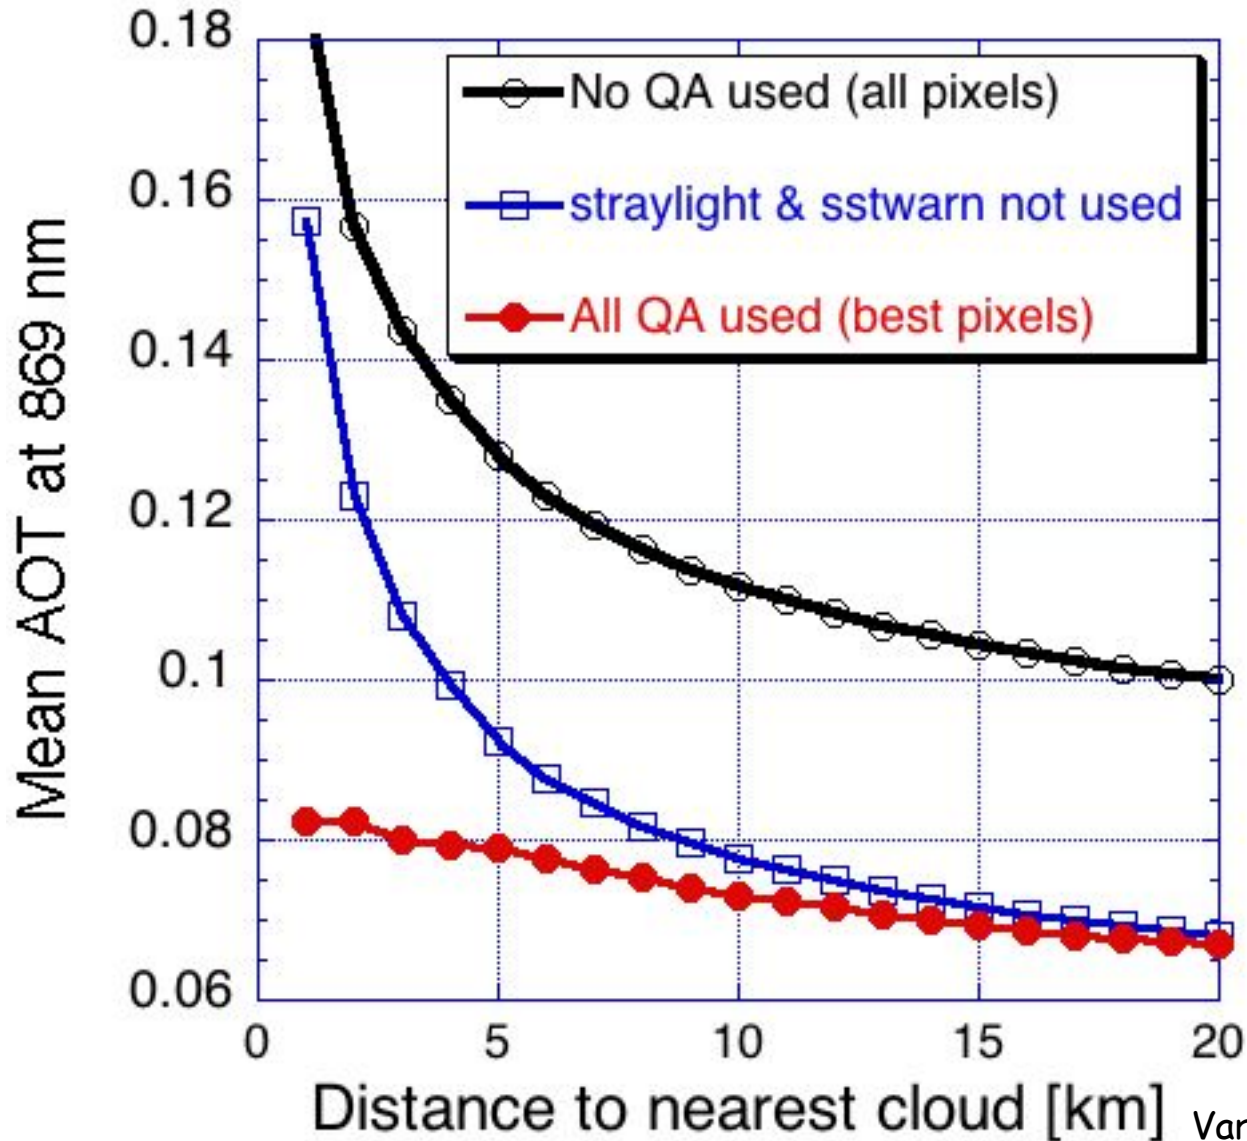

# MODIS Ocean Color Aerosol Product

2 Sep. weeks for 10 years (2002-2011) of MODIS obs.: southwest of UK

# MODIS Ocean Color Product: AOT @ 869 nm

# STRAYLIGHT flag

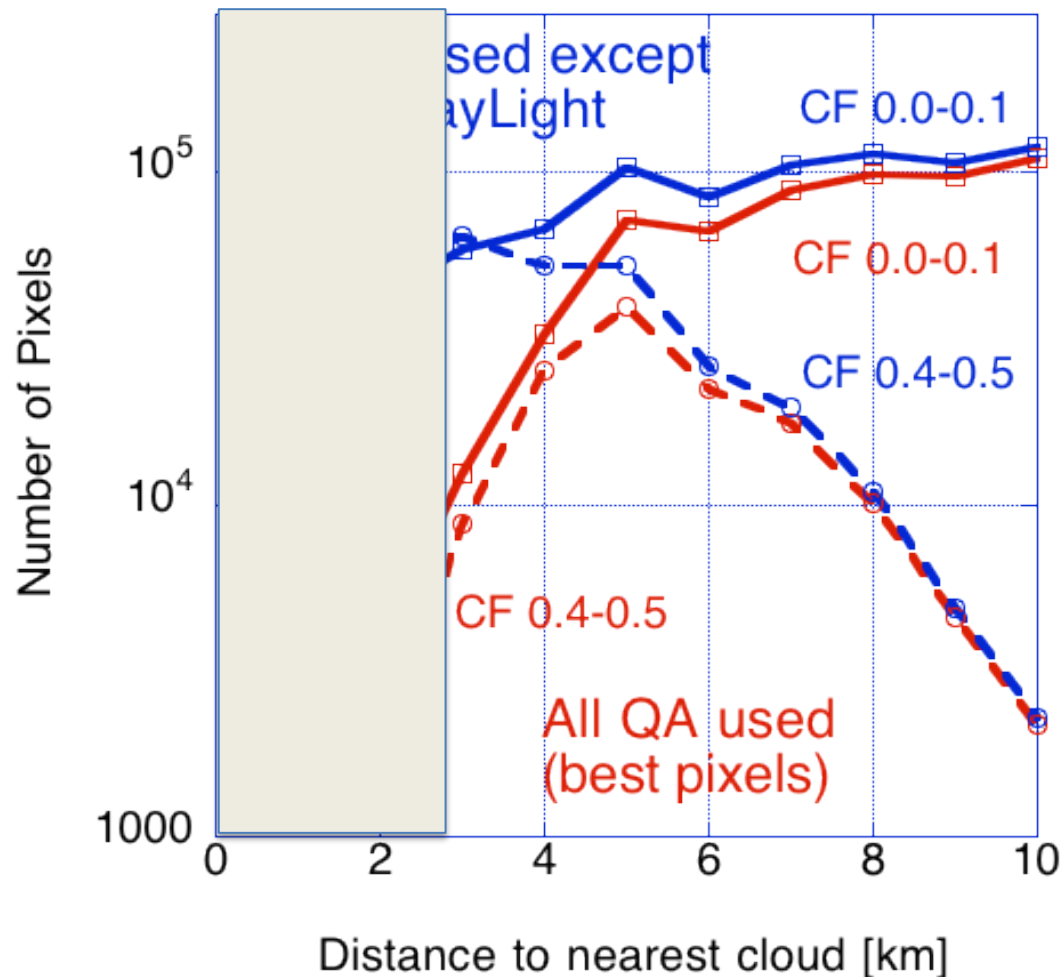

*Stray light from adjacent, bright sources such as cloud edges is known to contribute to error in SeaWiFS and MODIS ocean color retrievals. In MODIS/Aqua Reprocessing 1.1 (2005), pixels within a 7x5-pixel region around bright pixels were flagged as straylight and masked in Level-3.*

*This decision was based on the point-spread function as described in Meister et al. (2008) coupled with the lack of an adequate straylight correction capability for MODIS. ...*

*It should be emphasized that the straylight-contaminated pixels are flagged at Level-2 and masked at Level-3, so there is no impact to Level-2 coverage.*

# MODIS Ocean Color Product: AOT @ 869 nm

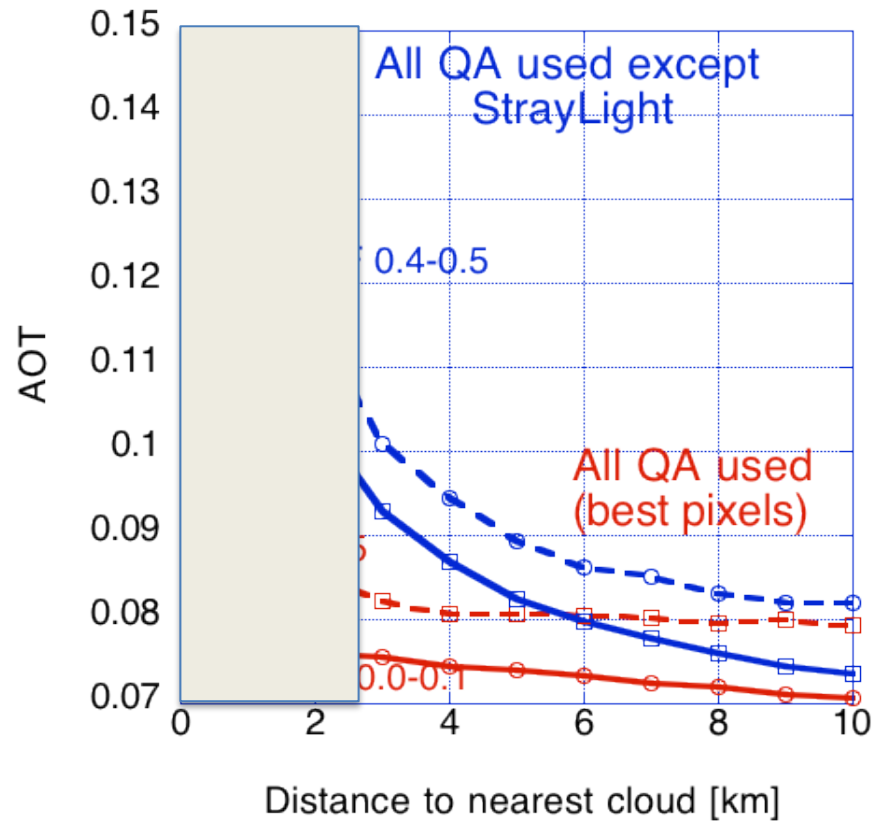

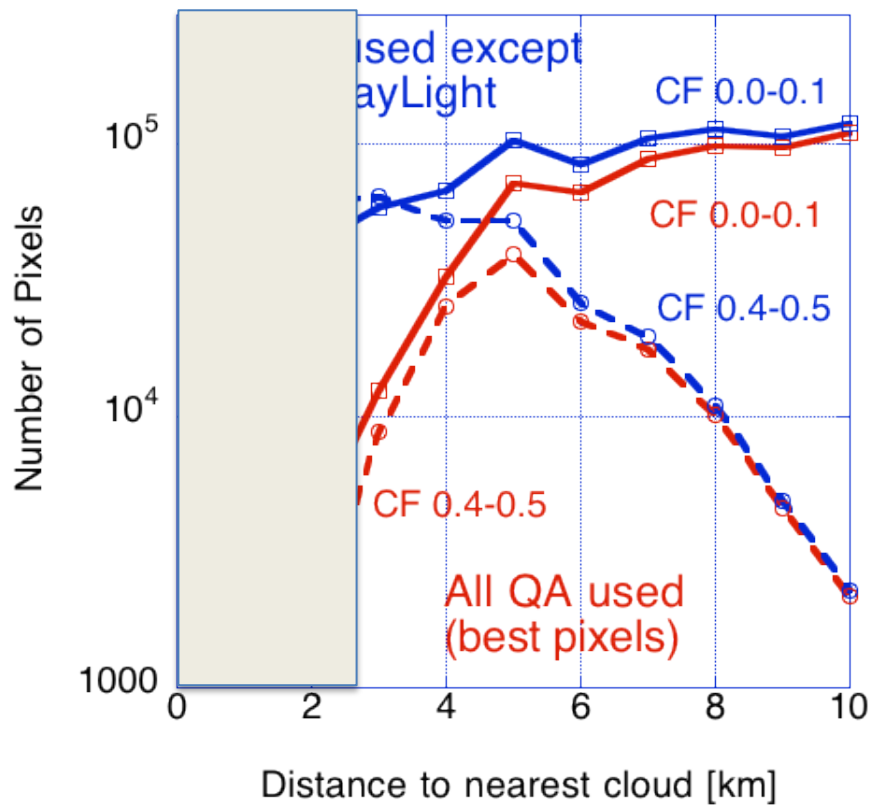

41 km x 41 km boxes; the same CF

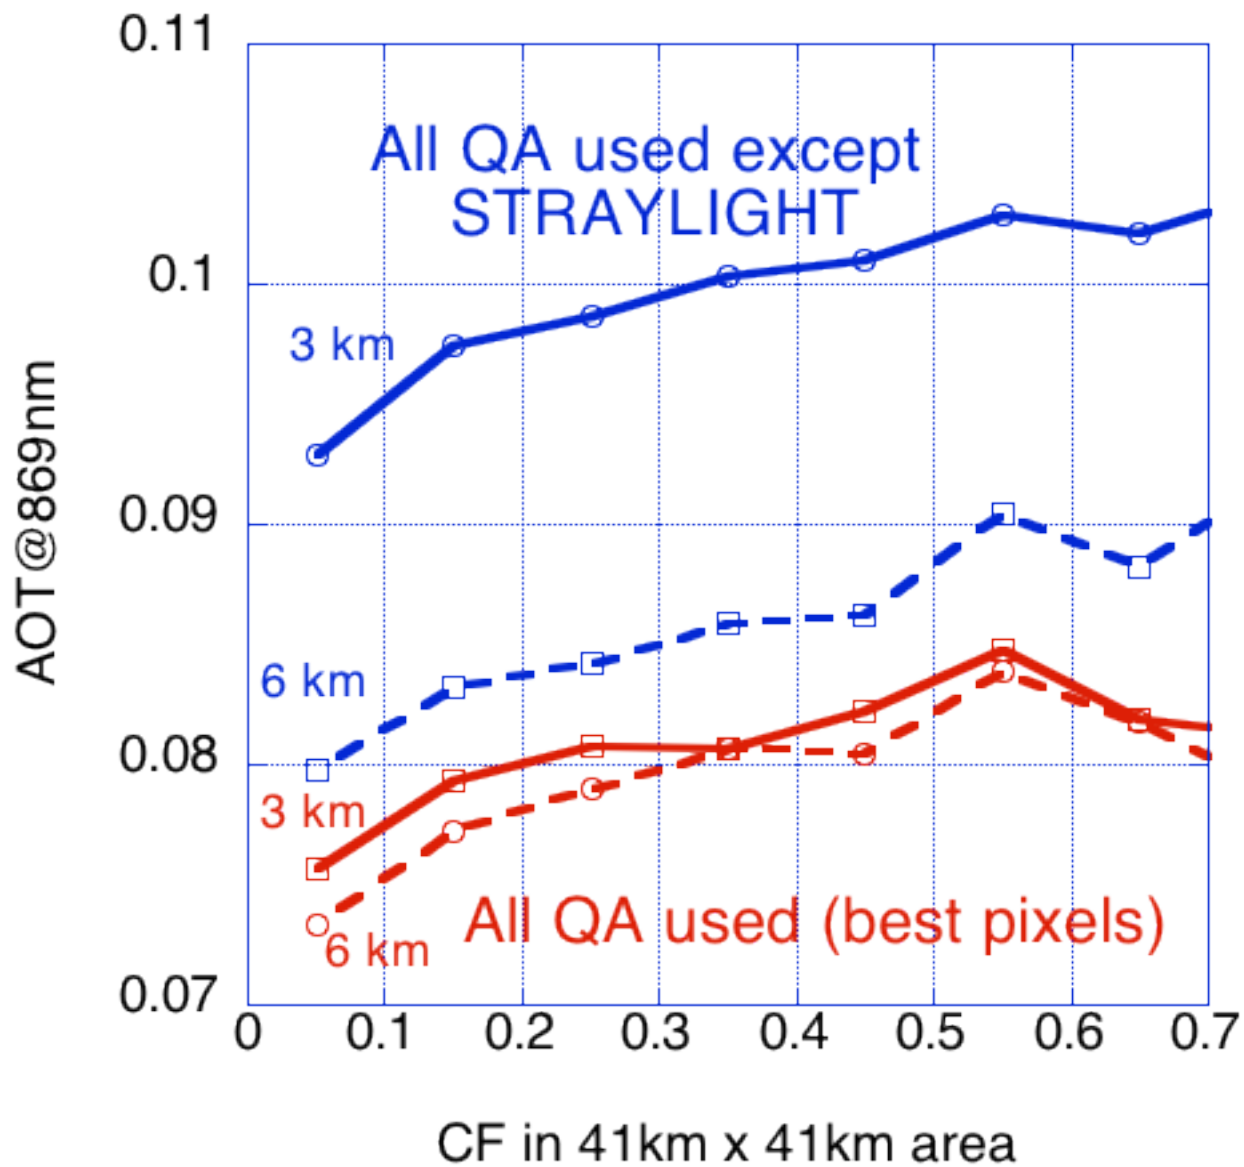

# MODIS Ocean Color Product: AOT @ 869 nm

## 41 km x 41 km boxes; the same CF

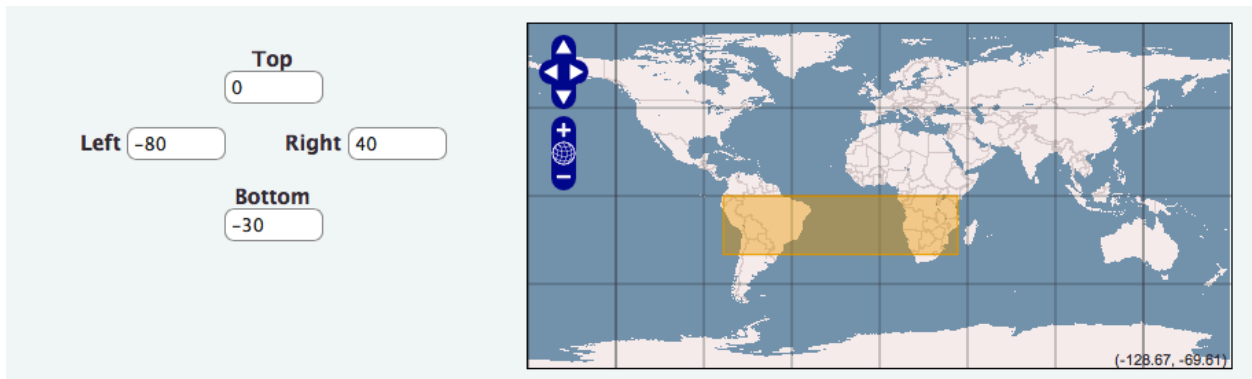

### Effect of a STRAYLIGHT flag

### 3 and 6 km from clouds

# Take home message

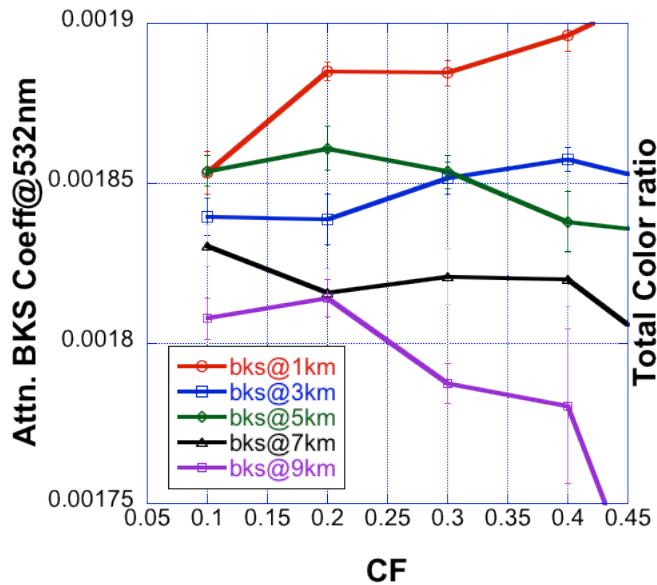

- Both passive and active measurements show that radiation is bigger near clouds. But radiation is not identical to AOD. There are other effects that increase *apparent* AOD near clouds, e.g., cloud fragments detrained from a nearby cloud or 3D radiative effects.
- There is also a sampling issue: pixels from different large-scale meteorological conditions are mixed together resulting to more higher humidity samples near clouds.
- This effect can be substantial; by our estimates its contribution is between 30% to 70%.
- Removing the statistical effect of sampling (comparing 'apples' and 'apples') reduces the difference between near and far from cloud AOD by factor of 1.5-3.
- As estimated earlier, for MODIS AOT, unaccounted 3D effects are responsible for 20-25% of the enhanced near cloud radiance. Now with an improved sampling strategy, its contribution is much bigger: between 30-75%. The rest are the small cloud elements and near-cloud changes in aerosol properties. The separation between these two factors is yet an open problem.

# CALIPSO

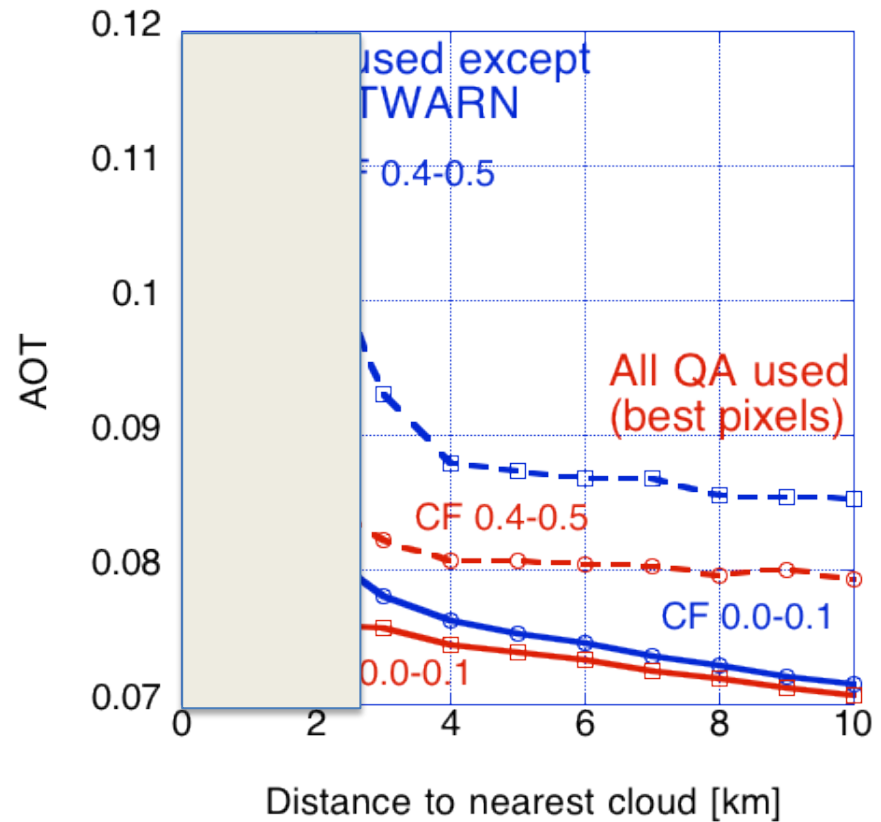

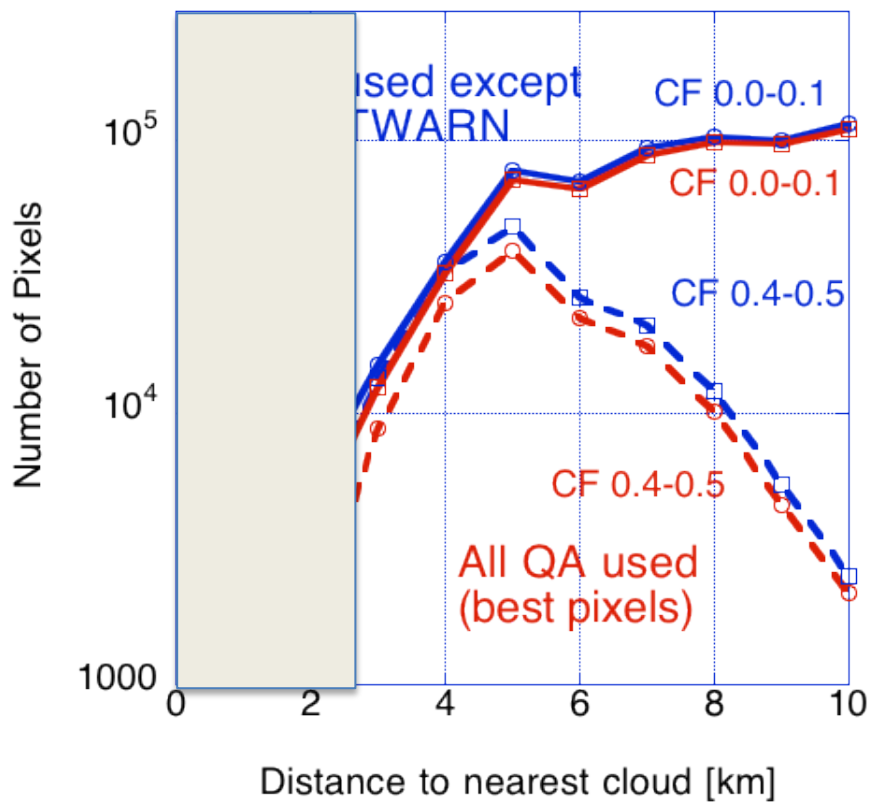

after re-sampling  
by setting the distribution of CF to be uniform  
from bin CF(0.0, 0.1) to CF(0.3, 0.4)

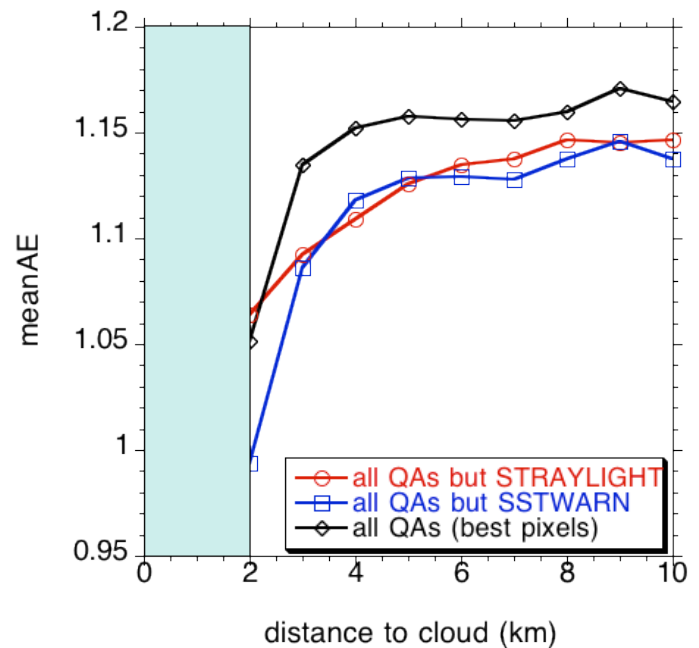

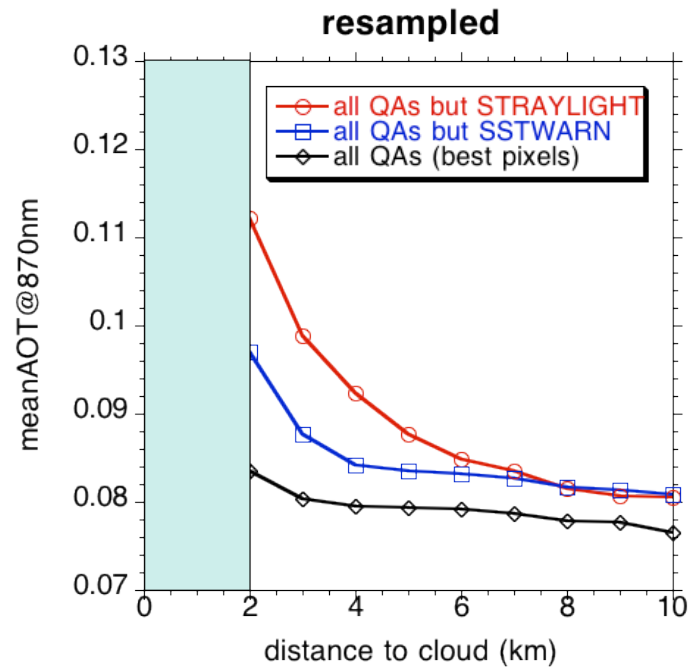

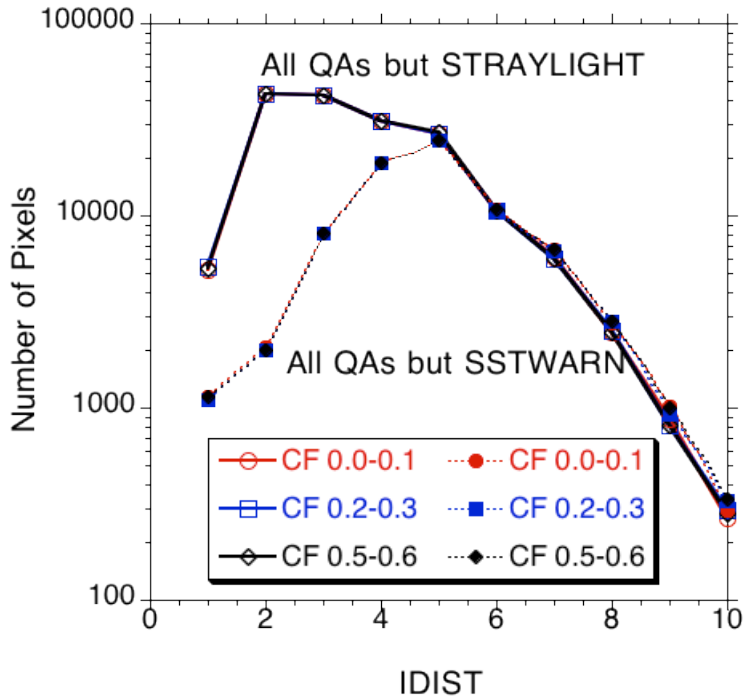

# MODIS Ocean Color Product: AOT @ 869 nm 41 km x 41 km boxes; the same CF

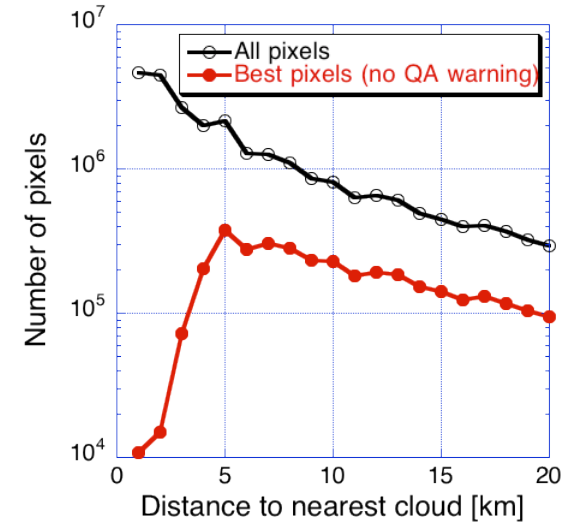

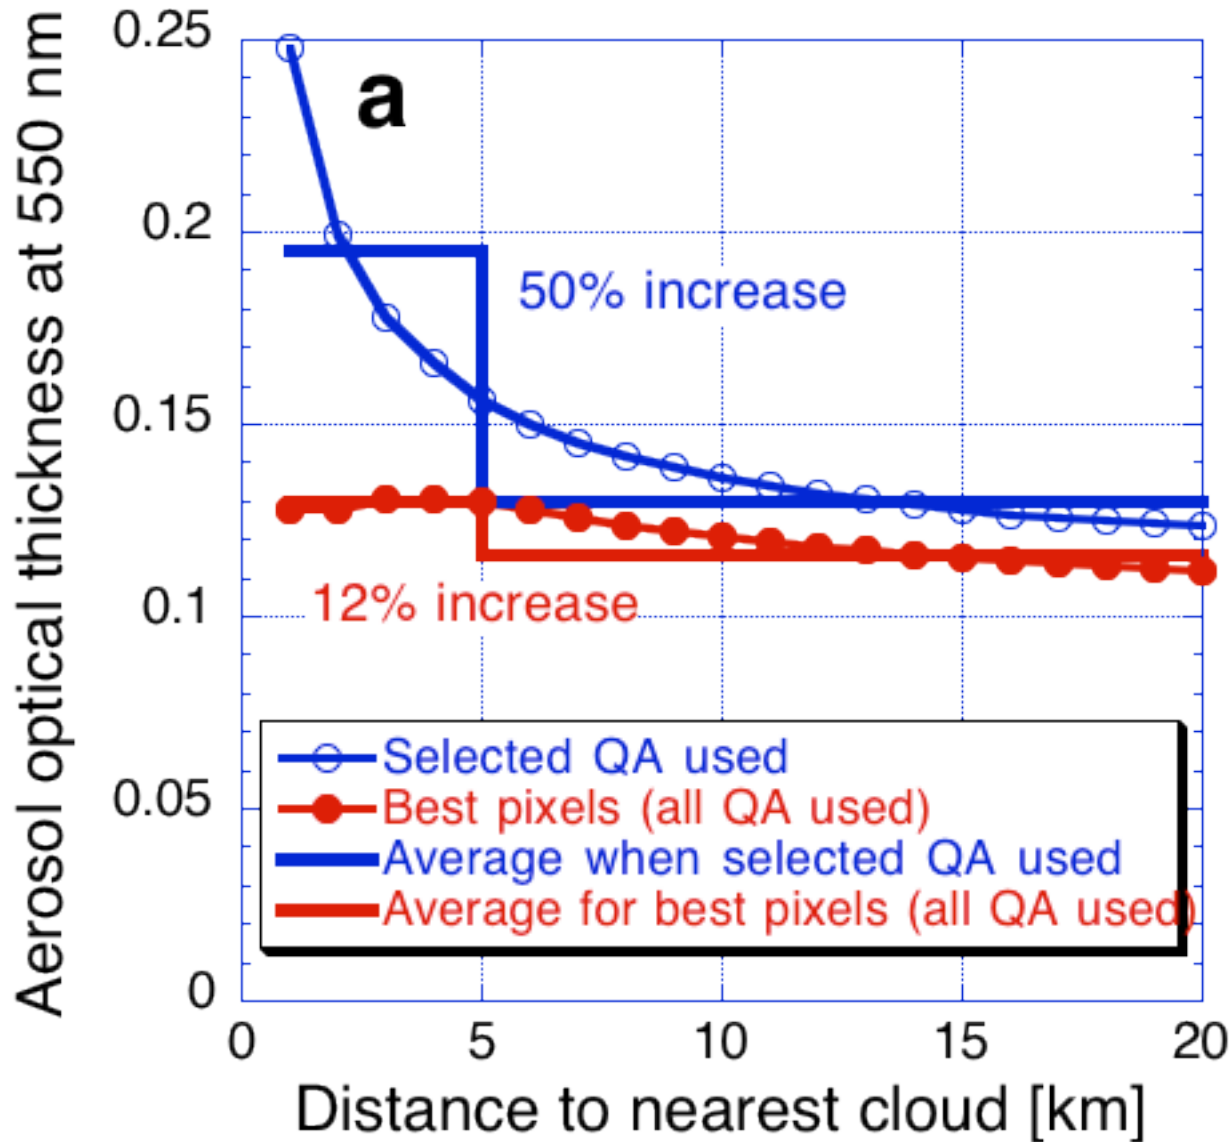

## Effect of a SSTWARN flag

# Re-sampling: equal number of pixels for each CF

# MODIS Ocean AOD @ 550 nm

excluding aerosols  
data near clouds will  
dramatically reduce  
the database

Chand et al. (2012) found a 25% enhancement in AOT between CF 0.1-0.2 and CF 0.8-0.9 which was "consistent with aerosol hygroscopic growth in the humid environment surrounding clouds."
