LLNL-PRES-647364

This work was performed under the auspices of the U.S. Department of Energy by Lawrence Livermore National Laboratory under contract DE-AC52-07NA27344. Lawrence Livermore National Security, LLC

Simulator to Bridge the Gap between GCM Clouds and Cloud Observations

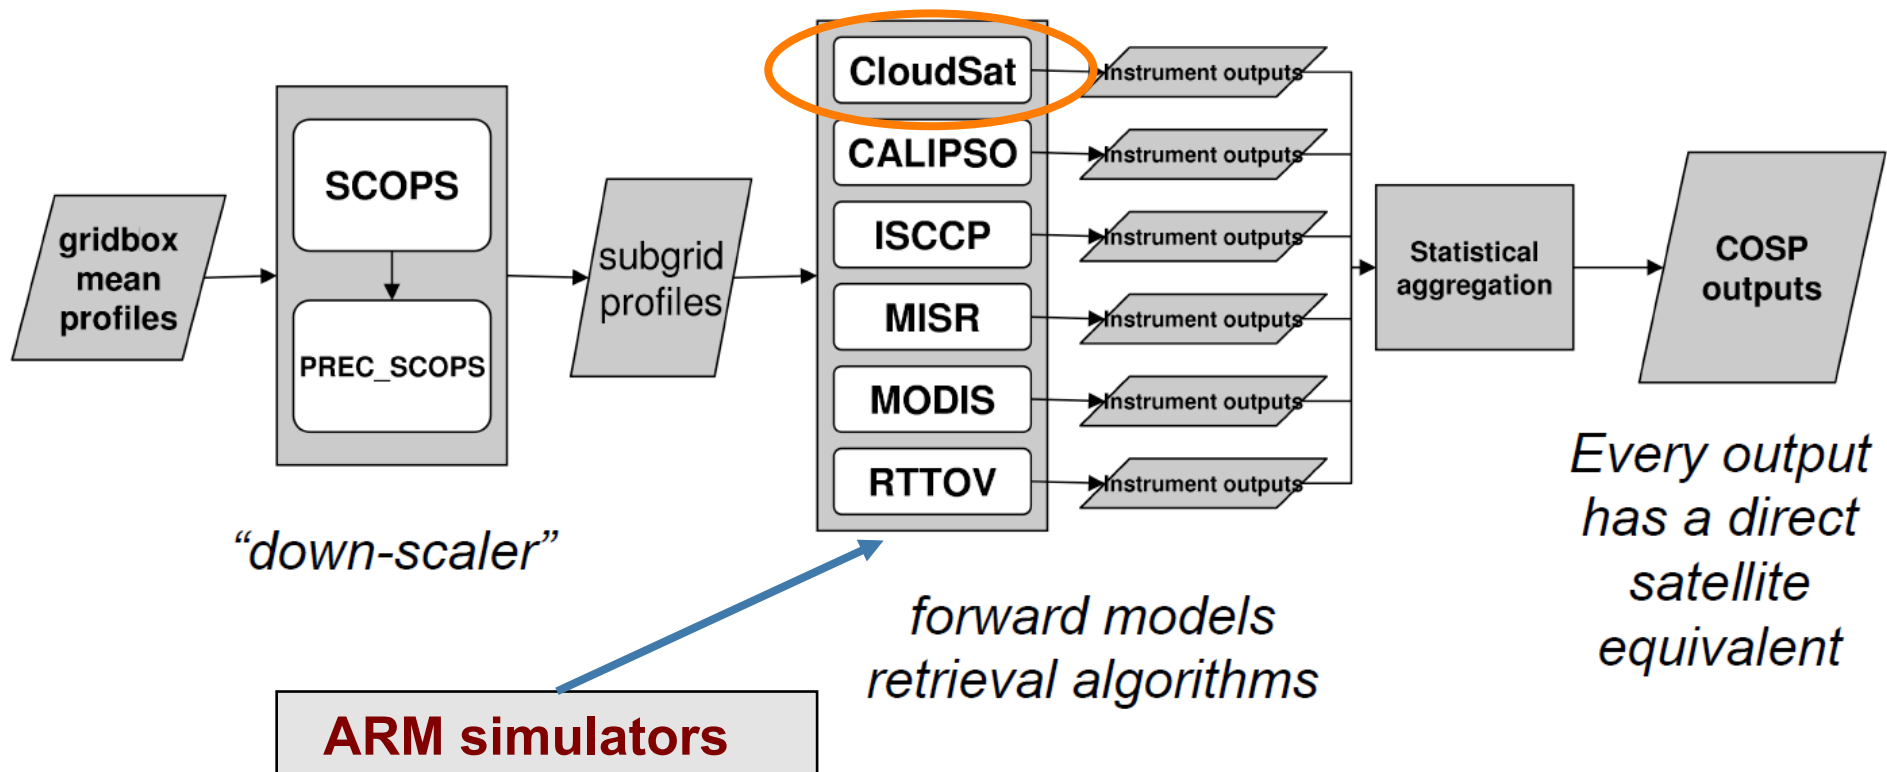

- Significant differences between how a climate model represents clouds and what ARM instruments see
 - scale of model grids (~ 100 km) vs. point measurements
 - model variables vs. instrument observables
 - different definition for clouds
 - Observation limitations (detected signal and attenuation of signals)

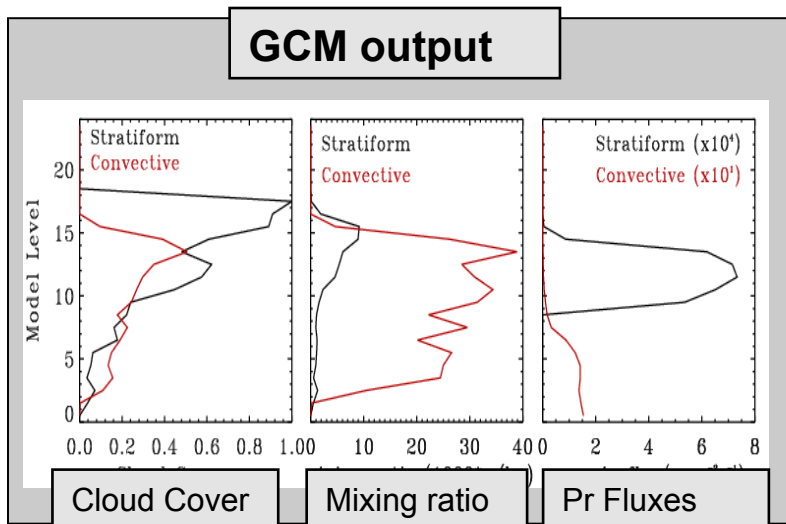

Ideas on the ARM Radar Simulator

- Take the advantage of COSP, the **CFMIP Observation Simulator Package**, by inverting the COSP CloudSat simulator for view from the ground and run at a different wavelength for the ARM ground-based remote sensors
- Make it as part of **COSP** for a broad use by the climate modeling community

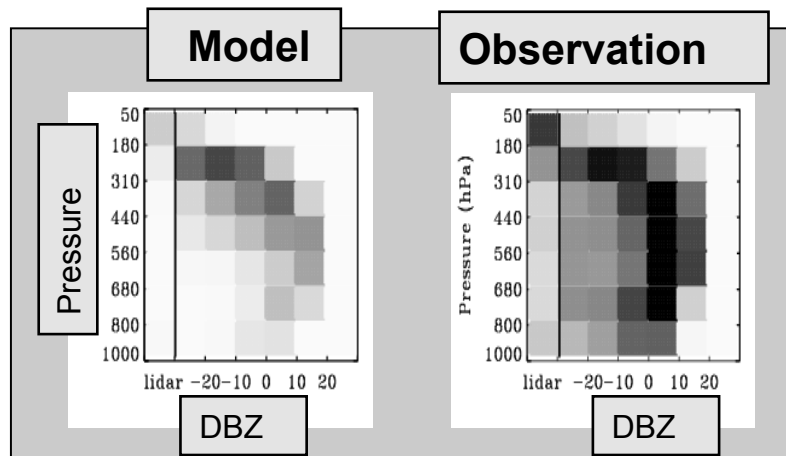

A Flowchart – ARM Radar Simulator

COSP "down-scaler" to generate subcolumn distribution

SCOPS + PREC_SCOPS

Statistical processing (a statistical module) to produce joint histogram

Radar simulator to convert model variables into pseudo-instrument obs

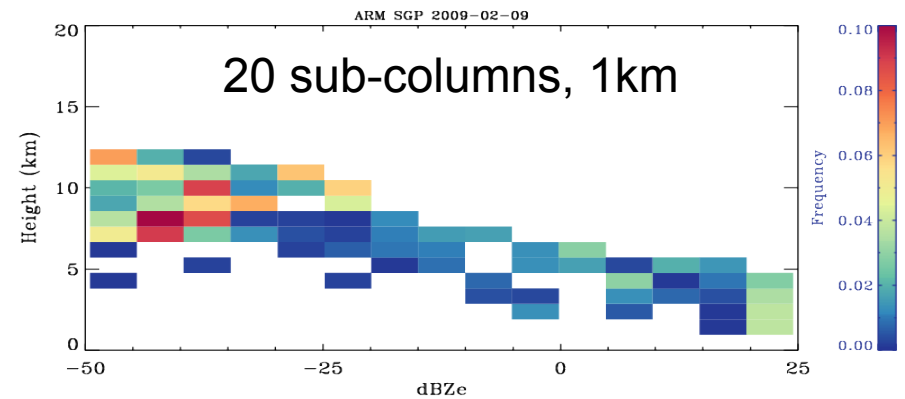

CFAD - The Contoured Frequency by Altitude Diagram (the reflectivity-height histogram)

Issues Need to be Addressed for an ARM Simulator

- Explore simulator uncertainties
 - Resolution
 - # of subcolumn
 - Minimum detectable signal threshold
 - Saturation value of radar reflectivity
 - Subgrid precipitation distribution
 - Simulator uncertainties associated with particle size distribution
- Address clutter issue with ARM cloud observations
 - How to address the clutter issue in ARM CFAD
- Explore strategies for model and ARM cloud comparison
 - *What is a suitable time and space scale for the comparison?*
 - *Diurnal cycle of clouds*
 - *seasonal mean and variability*

Sensitivity to the Number of Sub-column and Vertical Resolution

Feb 9th, 2009

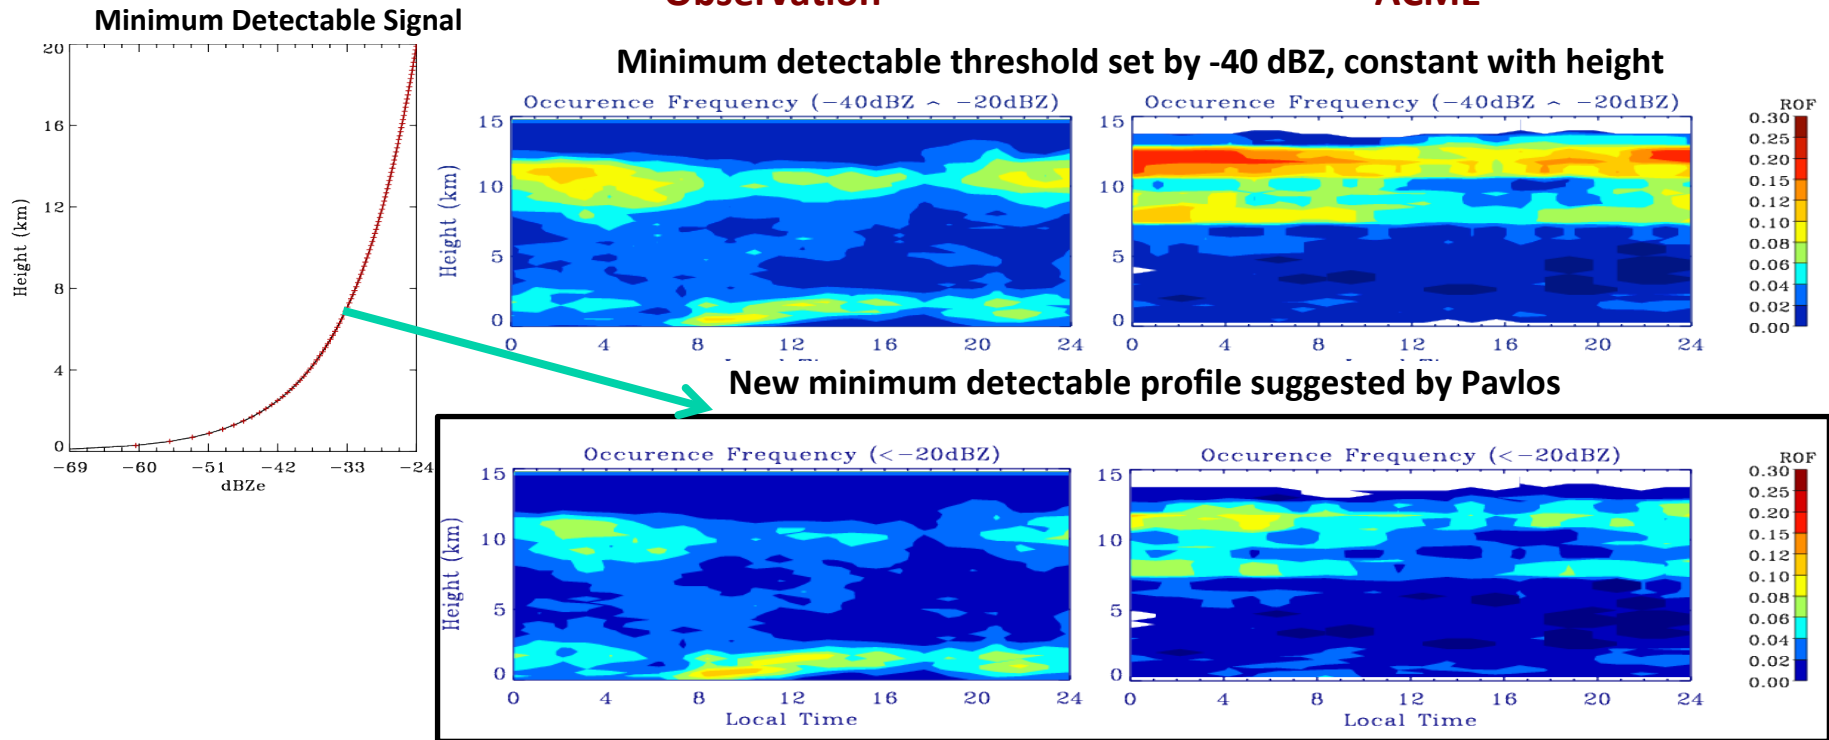

Currently we use 20 sub-columns and 100m resolution.

Impact of Minimum Detectable Signal Threshold and Maximum Instrument Recording Signal

Summer Diurnal Precipitation at SGP (2009)

Observation

ACME

We also tested the saturation value of radar reflectivity as a function of height: $\text{dBZ}_{\text{max}}(h, \text{ km}) = 20 + 20 \cdot \log_{10}(h, \text{ km})$. The impact is insignificant

Thank Pavlos Kollias and Eugene Clothiaux for providing the MDS and the maximum radar reflectivity profiles and valuable comments/suggestions

Clutter Issue

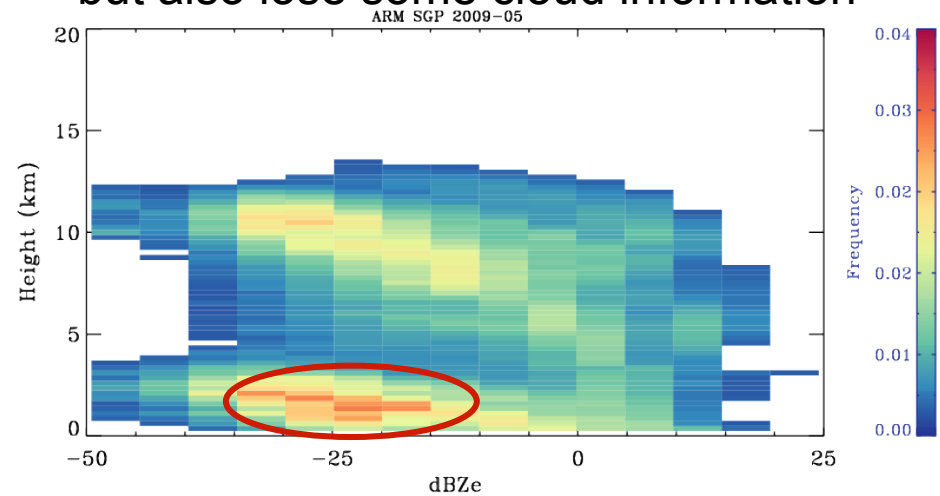

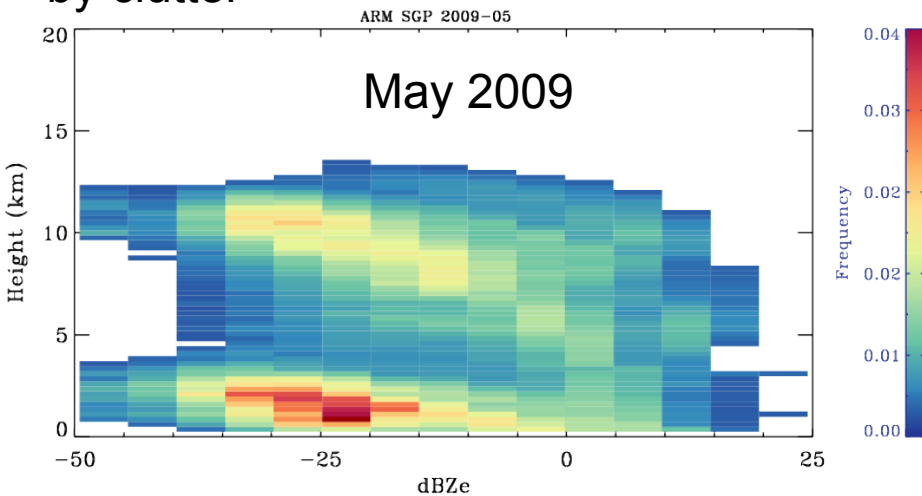

CFAD generated with & without clutter

qc-flag = 1 or 2

qc-flag = 1

MMCR reflectivity may be contaminated by clutter

MMCR reflectivity with clutter removed, but also lose some cloud information

Karen Johnson is appreciated for her valuable comments and suggestions

Application to ACME

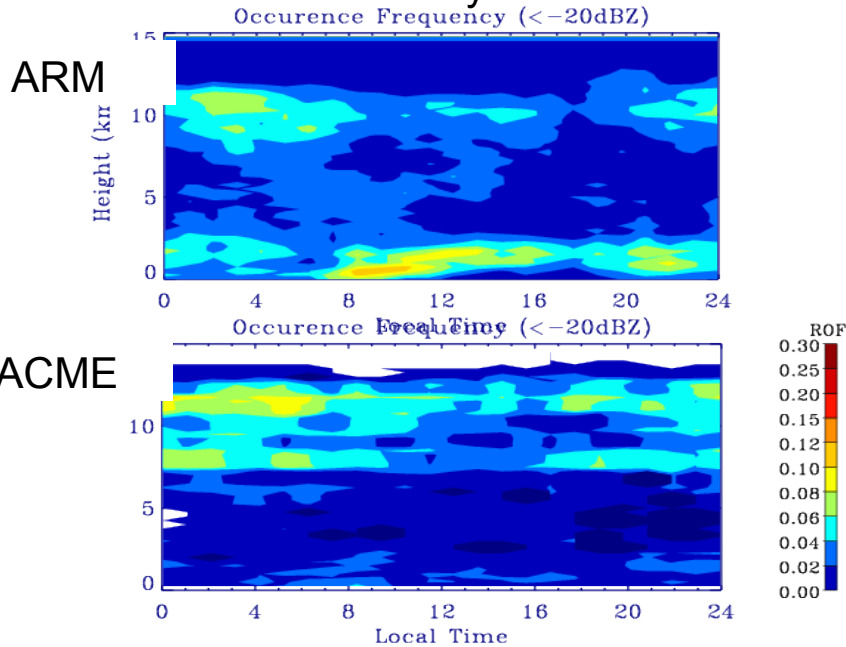

High Frequency ARM OBS Allows Model Evaluation on Different Time Scales

Hourly radar CFAD

Diurnal Cycle

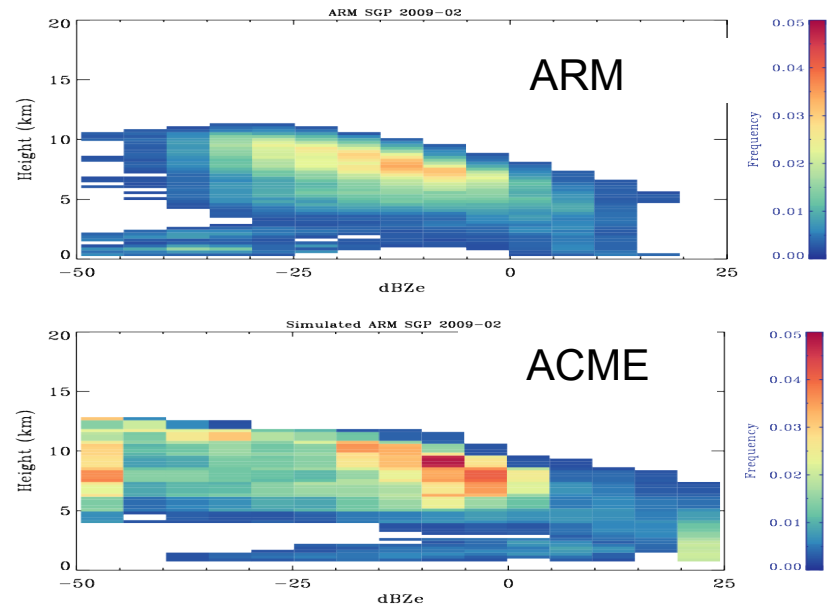

Monthly/Seasonal Mean

Warm season diurnal cycle of clouds at SGP

lack of non-precipitating shallow clouds

CFAD for the month of Feb 2009

produces too much precipitating clouds at middle and high levels

Progress

- Completed V0 ARM cloud radar simulator development
 - ✓ Incorporate the ARM cloud radar simulator onto both COSP1.4 and COSP2.0 and ready to release
 - V1 will add the non-attenuated, Rayleigh-scattering only, radar reflectivity CFAD to the simulator output
- Developed Multi-year CFAD from ARSCL/KAZR-ARSCL for model evaluation
 - ✓ *Data are at hourly, 100m vertical resolution, 5 dBZ bin in the range of -50 dBZ to 25 dBZ.*
 - ✓ *Consider impact of clutter/insects on radar signal*
 - ✓ *5-yr CFAD for 2006-2010 and some months in 2011 are done*
 - *Will extend the data to the most recent years once the KAZR-ARSCL data are available*
- Applied to ACME
 - ✓ Applied the ARM cloud radar simulator offline on sample output from ACME around the ARM SGP site during its convection tests
 - will work with other modeling centers including both NWP and climate centers (ECMWF, NCEP, GFDL, MetOffice, Metro-France, ...) to promote its application

Future plan

- Working with ARM and the COSP PMC to release the ARM simulator to the committee
- Extend the long-term ARM GCM-oriented cloud radar data (CFAD) at ARM permanent sites and AMF sites once the KAZR-ARSCAL data are available
- Refine and improve the ARM radar simulator
 - Add the non-attenuated, Rayleigh-scattering only, radar reflectivity CFAD to the simulator output and refine the code structure to make it more flexible for future modification
- Work with modeling centers for its applications
 - ACME, CESM, ECMWF, NCEP, GFDL, MetOffice, Metro-France, ...
- Explore strategies for model-observation comparison and provide recommendation to the community
- Documentation, user guide, and distribution
 - Journal papers, Technical report, distributing the ARM simulator package*
