### ACME-V mission in the North Slope of Alaska (Airborne Carbon MEasurements)

LBNL: Sébastien Biraud & Margaret Torn BNL: Art Sedlacek & Stephen Springston AAF: mentors and support Team and many others

Crew members (from left to right). Clayton Eveland, John Hubbe, Allen Cordle, Sebastien Biraud, and Albert Mendoza

#### ARM/ASR PI meeting, Tysons, May 3, 2016

# Why do we care about the Arctic (land)?

Atmosphere Today ~800 PgC (~400 ppm)

Arctic soils contain = 1300+/-200 PgC (Tarnocai et al, GBC, 2009)

#### Sufficient frozen C in the Arctic to increase atmospheric CO<sub>2</sub> by 2-to-3

Large spatial heterogeneity in:

- Inundation
- Surface albedo

## Why an airborne campaign?

#1: What controls spatial and temporal variability in atmospheric CO<sub>2</sub> and CH<sub>4</sub>?

#2: Can we use multi-species observations to distinguish between biogenic, thermogenic, and anthropogenic sources of  $CO_2$  and  $CH_4$ ?

#3: What are the implications for radiative forcing?

#4: What can we learn about spatial variability of surface characteristics between Oliktok and Barrow?

#5: Can we estimate  $CH_4$  emissions at regional scale?

## Our Implementation – ACME-V campaign

#### Use of ARM & AAF assets

- Trace gas observations
- Clouds and aerosols property observations
- Solar and infrared radiation measurements

#### - Focused on NSA

- Flight path crisscrossing region
- Anchored by established ground-sites

#### - Frequent flights

- 2015: June 1 (DOY=158) September 15 (DOY=258)
- 38 flights
- 140 science flight hours

#### - Low elevation flights

- < 500m agl
- With vertical profiling over fixed-sites

### **#1: Spatial/Temporal Variability in CO<sub>2</sub> and CH<sub>4</sub>**

### #1: Vertical Profiles over fixed Sites

### #2: Biomass Burning influence

- Elevated CO mixing ratio (and refractory Black Carbon)
- Aerosols stratification
- => Document aerosols properties over the Arctic

See Sedlacek et al. poster

### #3: Implication for Infrared Radiative Forcing

See Feldman et al. poster

### #4: Spatial Variability of Surface Albedo

#### Preliminary data!

- Solar radiation measured by Delta-T SPN1
- Upwelling radiation corrected for aircraft tilt (Long et al., 2010)
- Albedo = Nadir / Zenith

=> Large spatial and temporal variability

## **#5: Estimate of CH₄ source at Ecosystem scale**

#### Eddy Covariance Technique (ARM ECOR datastream and CH<sub>4</sub> VAP)

# **#5: Estimate of CH<sub>4</sub> source at Regional scale**

### CH<sub>4</sub> FLUX optimization framework

#### Observations

CH<sub>4</sub> enhancement over background (ARM-ACME-V) with no anthropogenic influence (CO < 150 ppb)

#### VS.

#### Model

Calculated CH<sub>4</sub> enhancement using CH<sub>4</sub> flux model (Henderson et al., ACP, 2014)

#### ×

surface influence (WRF-STILT 3.5.1; Lin et al., JGR, 2003)

(Commane et al., in prep)

### **#5: Estimate of CH<sub>4</sub> source at Regional scale**

September 9, 2015 flight (Tundra)

## **#5: Estimate of CH<sub>4</sub> source at Regional scale**

(Adapted from Zona et al., PNAS, 2016) (Biraud et al., in prep)

Source from: NASA CARVE data: Miller (JPL) Eddy flux: Zona, Oechel (SDSU); aircraft+WRF+STILT: Commane, Lindaas, Chang (HU), Sweeney, Karion (NOAA) #1: Drivers of spatial heterogeneity are different for CO<sub>2</sub> versus CH<sub>4</sub>

#2: Mutli-tracers approach can be used for sources attribution (wildfire, fossil, and ecosystem)

#3: Vertical profiles are necessary to estimate CO<sub>2</sub> and CH<sub>4</sub> radiative forcing,

#4: It is critical to have better spatial coverage of surface properties, along the Oliktok/Barrow transect

#5: North Slope  $CH_4$  fluxes peak in Mid-July through early September, and do not appear to be significantly increasing over time.

- Next Steps:
  - Apply framework to estimate regional fluxes of CO<sub>2</sub>,
  - We hope for the opportunity to expand flights over shoulder season, as studies points out significant contribution to annual fluxes,
  - Use UAs at Oliktok to increase spatial coverage around fixed-site
