What you need to know to be a bundle pro

- What is a LASSO Data Bundle?
 - ▶ Model input vs. model evaluation
- Model evaluation
 - ▶ Diagnostics
 - ▶ Model skill scores
- Data Bundle Observations
 - ▶ Alpha 1 release
 - ▶ Alpha 2 release
- Interactive querying: The LASSO Bundle Browser (Bhargavi)

What is a LASSO Data Bundle?

Package of observations and simulations (aka, a “data structure”) aimed at providing the best description of the atmosphere

1. Case descriptors

- Cloud type, weather state, inversion strength, etc.

2. Evaluation metrics

- Model-observation diagnostics
- Model skill scores
- The observations used

3. Model input and output fields

- Includes 3-D model fields, profile statistics, and model-based budget terms
- Forcings and initial conditions

Navigate

Find

Model input vs. model evaluation

- Model initialization and forcing generation
 - ▶ Can assimilate meteorological variables
 - T, P, water vapor mixing ratio, winds (plus non-ARM other NCEP data)
 - Prefer observations that are as all-weather as possible
 - ▶ Cannot assimilate cloud variables or surface fluxes
 - These properties are either specified (fluxes) or used for evaluation (cloud)

Initialization and Forcing

Alpha 1

- Sonde profiles @6 h (T, P, wv, winds)
- Surface MET and Mesonet data @1 h (T, P, wv)

Alpha 2, the above plus:

- Hourly boundary layer profiles (T, P, wv, winds)
(Raman lidar/AERloe, Radar wind profiler)

- Ensemble LES simulations are assessed using ARM observations of cloud and environmental variables
 - A diagnostic plot compares model output to observations
 - ▶ “Like” processing of a quantity (e.g., LCL)
 - ▶ Use of instrument simulators to make the model output look like instrument observations [Breakout Session, Thursday, 1:45 pm – 3:45 pm: “From Models to Virtual Observatories using Simulators”]
 - Diagnostics used
 - ▶ Time series
 - ▶ Taylor diagrams
 - ▶ Regression analyses
 - ▶ 2-D cloud masks
 - ▶ Heat maps
 - ▶ Phase space relationships
- Pre-computed plots in the data bundles
 - Interactive (Bundle Browser)

LASSO model skill scores

- Skill scores, based on the diagnostic plots, assign a numerical value to the level of model-observation agreement
- Enables assessing the ensemble model simulations (e.g., Alpha 1 had ~30-40 simulations per case!)

Alpha 1: Focus on Central Facility

- 5 case days with model initialization and validation based on point measurements at the SGP central facility (CF).
- Observations include cloud and environmental variables at the CF:
 - ▶ Cloud:
 - Cloud fraction (TSI, ARSCL)
 - Liquid water path (AERloe, MWR-2C)
 - 2-D time-height cloud location (ARSCL)
 - ▶ Environment:
 - Meteorological variables at the surface and aloft
 - Soundings (T, qv, RH, Θ , Θ_e) every 6 h
 - Hourly qv, RH, T at surface (MET) and at mid-BL (Raman Lidar)
 - LCL (computed from MET)

Alpha 2: Focus on Regional Observations

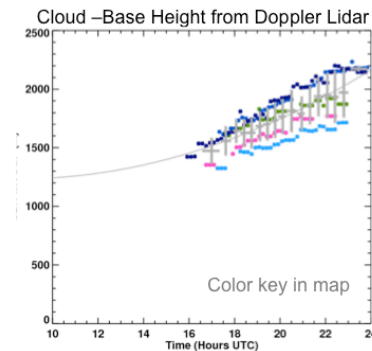

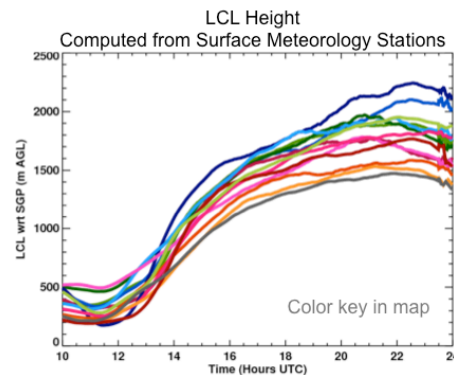

- 14 case days with model initialization and validation using measurements from the CF, Intermediate Facilities (IF), and Extended Facilities (EF).
- Include more observations, particularly focused on boundary layer properties. New to Alpha 2 are:

► Cloud

- Improved and regional liquid-water path (AERLoe v2.4)
- Cloud-base height (Doppler Lidar)

► Environment

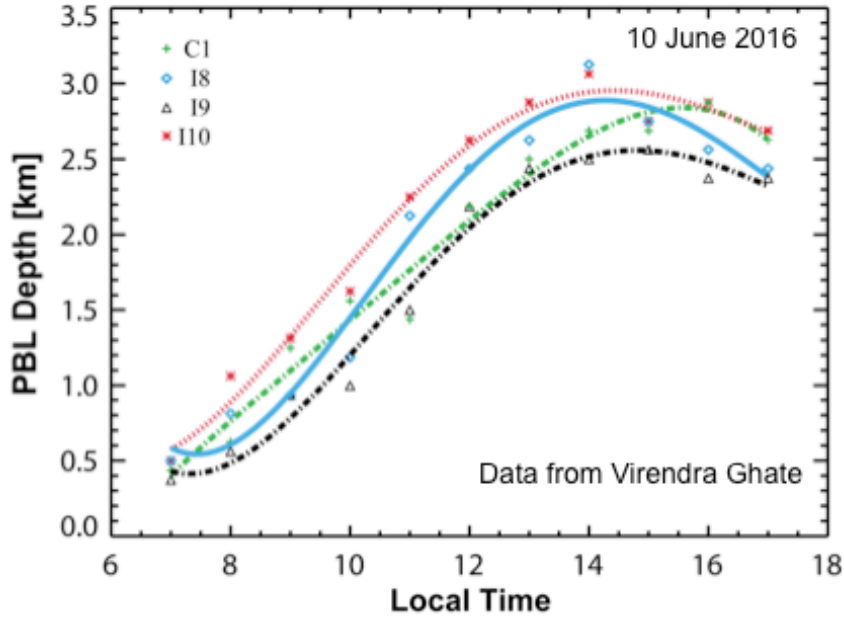

- Planetary boundary layer height (Radar Wind Profiler)
- Vertical velocity variance (Doppler Lidar)

Alpha 2: More regional variation!

Planetary Boundary Layer (PBL) Depth from Radar Wind Profiler Data

Vertical Velocity Variance from Doppler Lidar Data
