What is a code sprint?

“A **sprint** is a get-together of people involved in a project to further a *focused development* of the project. Sprints typically last from one week up to three weeks.”

Wikipedia

What is a code sprint?

“A **sprint** is a get-together of people involved in a project to further a *focused development* of the project. Sprints typically last from one week up to three weeks.”

Wikipedia

And why did we try one?

ARM Value-Added Product (VAP) development has historically taken more time than we'd like and resources are limited.

Could intensive in-person collaboration between ARM developers and science leads make a difference?

Goals for ARM's VAP Code Sprint

Scanning ARM Cloud Radar
(SACR) Data ✓

Four advanced SACR
algorithms already coded up ✓

**Mad Scientist
software**

```
for (i = 1; i <= n; i++) {  
  for (j = 1; j <= n; j++) {  
    for (k = 1; k <= j; k++)  
      p = p * 20 * z;  
  }  
}
```

Sprint Objectives

Convert 4 advanced SACR scientific codes into official **ARM VAPs**:

- **SACRADV-VAD** Vertical profiles of horizontal wind speeds / directions
- **SACRADV-QVP** Quasi-vertical profiles of polarimetric variables
- **SACRADV-3D3C** 3D Cartesian gridding, cloud cover, CFADs

Science Leads: Pavlos Kollias, Eugene Clothiaux, Mariko Oue, Katia Lamer

Developers: Tami Toto, Meng Wang, Karen Johnson

Sprint nuts and bolts

June 23 – 30, 2016

Day 1:

- Assign science lead and developer for each VAP
- Split into groups to develop VAP Implementation Plans

Days 2-7

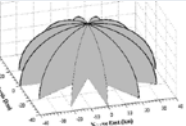

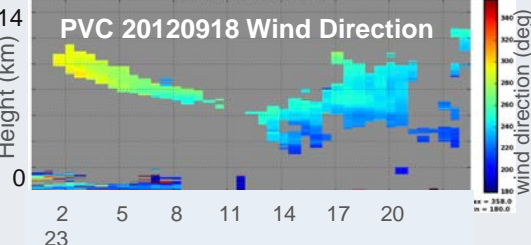

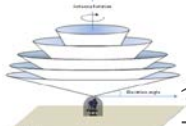

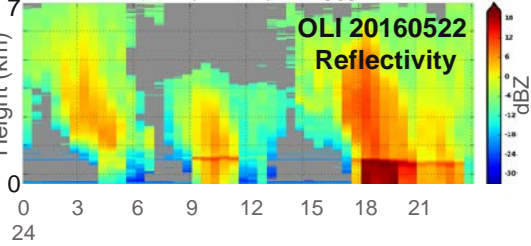

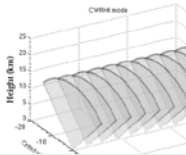

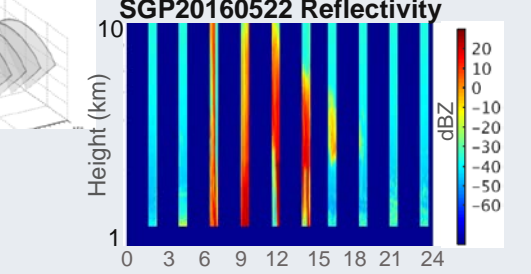

- Gather in a common room
- Code, asking questions, sharing solutions, consulting ADI* experts
- Discuss day's progress, plan next day
- Document each VAP's status, issues, next day's goals in code sprint 'diary'

Activities included:

- Refining input sources
- Designing output formats
- Revising implementation plans
- Converting coding language
- Optimizing code for speed
- Validating with test data

Sprint Results

Product	End-of-sprint Status	Post-sprint Tasks / Status
 <p>HSRHI input</p> <p>SACR ADV - VAD</p>  <p>PVC 20120918 Wind Direction</p> <p>Height (km)</p> <p>Time (hrs)</p>	<ul style="list-style-type: none"> * Converted to Python * Implemented in ADI * Validated (1 test file) 	<ul style="list-style-type: none"> * Many data issues handled * ARM standard format <p>Completed, In Evaluation <i>Poster by T. Toto</i></p>
 <p>PPI input</p> <p>SACR ADV - QVP</p>  <p>OLI 20160522 Reflectivity</p> <p>Height (km)</p> <p>Time (hrs)</p>	<ul style="list-style-type: none"> * Implemented in ADI 	<ul style="list-style-type: none"> * Optimized for speed * Many data issues handled * ARM standard format <p>Completed, OLI in Evaluation</p>
 <p>CWRHI input</p> <p>SACR ADV - 3D3C</p>  <p>SGP20160522 Reflectivity</p> <p>Height (km)</p> <p>Time (hrs)</p>	<p>Cloud Fraction:</p> <ul style="list-style-type: none"> * Implemented in ADI * Validated results <p>Gridding:</p> <ul style="list-style-type: none"> * Language conversion begun 	<ul style="list-style-type: none"> * Converted and implemented in ADI * Validation issues handled * Data issues handled * Processing speed remains very slow... <p>Evaluation data soon, SGP</p>

What Worked?

Development was jump-started!

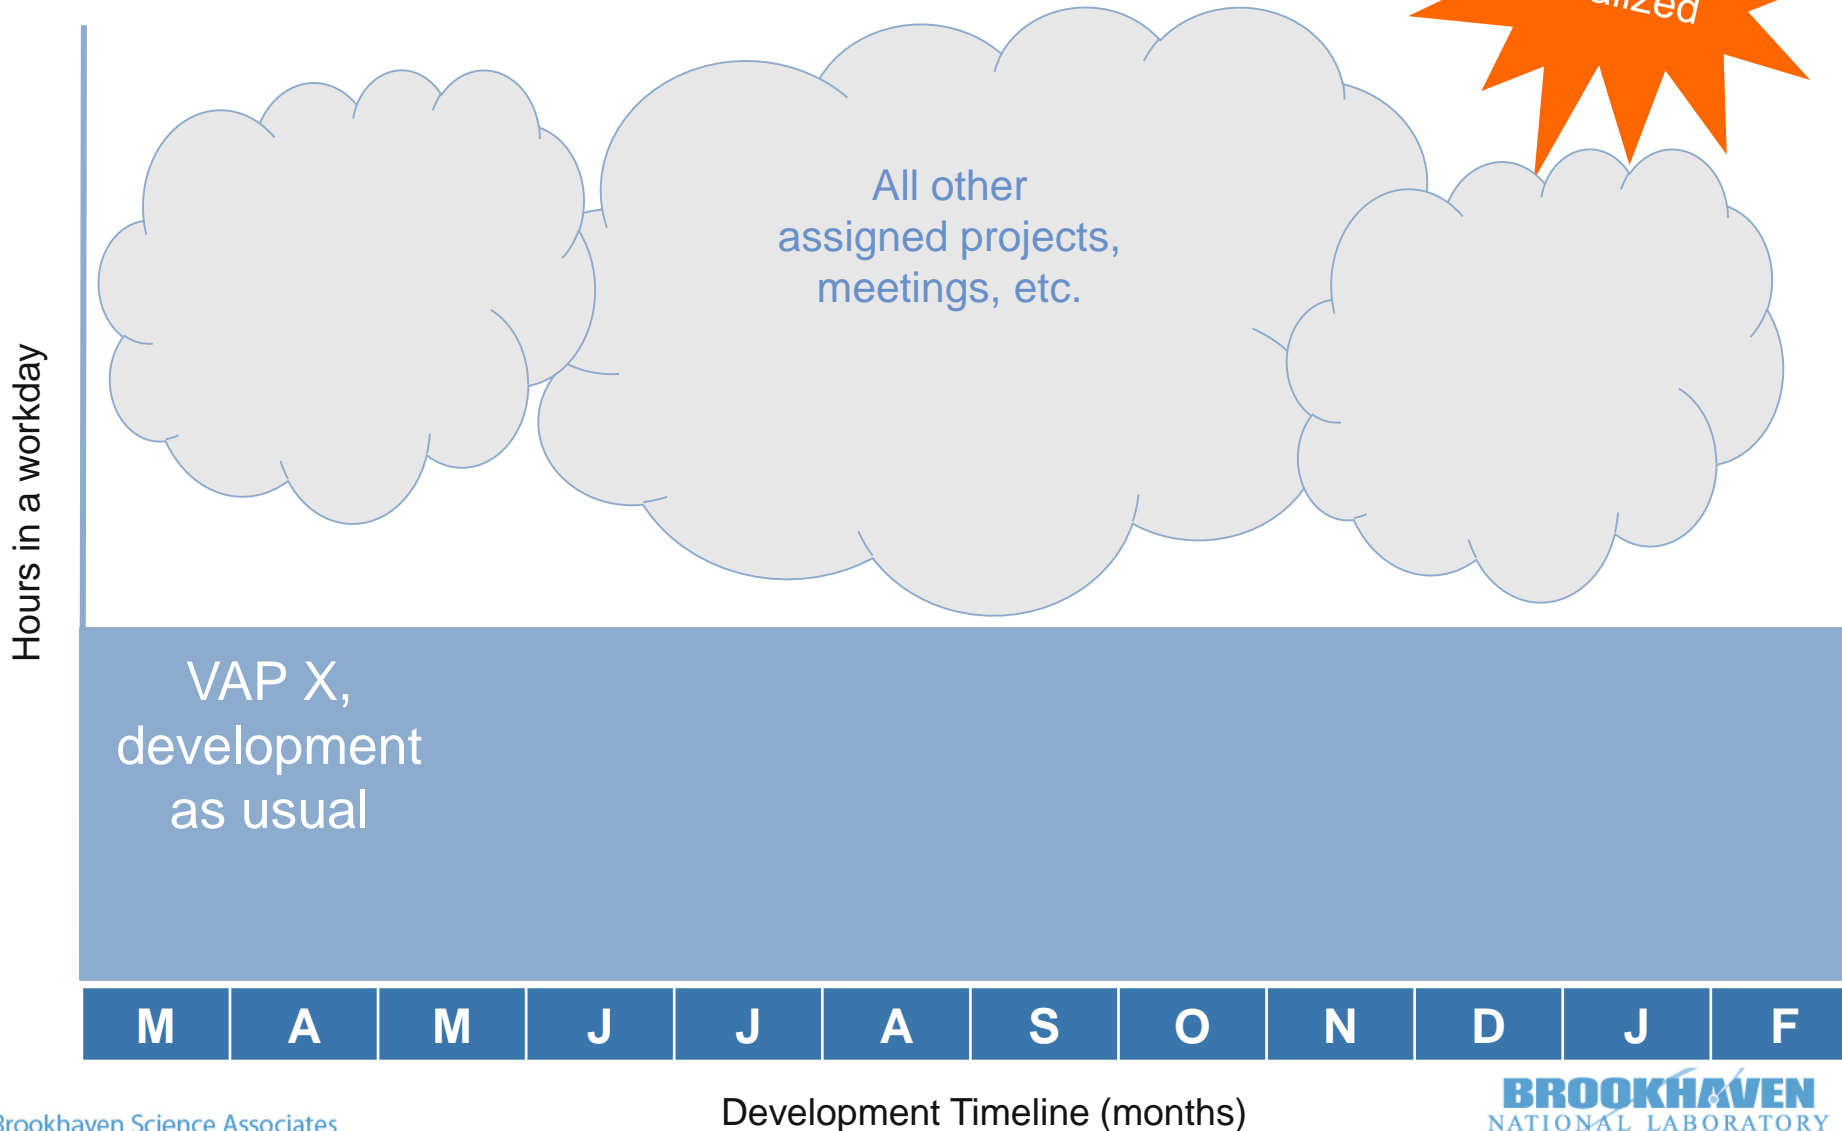

- **Focused time!**
Avoids email sidetracks, meetings, telecons, unrelated conversations
- **Science sponsor – Developer interaction *very helpful***
Speeds understanding of code and avoids wrong assumptions
- **Multiple developers together**
Speeds resolution of technical issues
- **Learning opportunities**
Broadens skill sets
- **Building relationships within program**
Encouraging scientific \leftrightarrow technical communication
- **VAPs available for evaluation!**

The rest of the story...

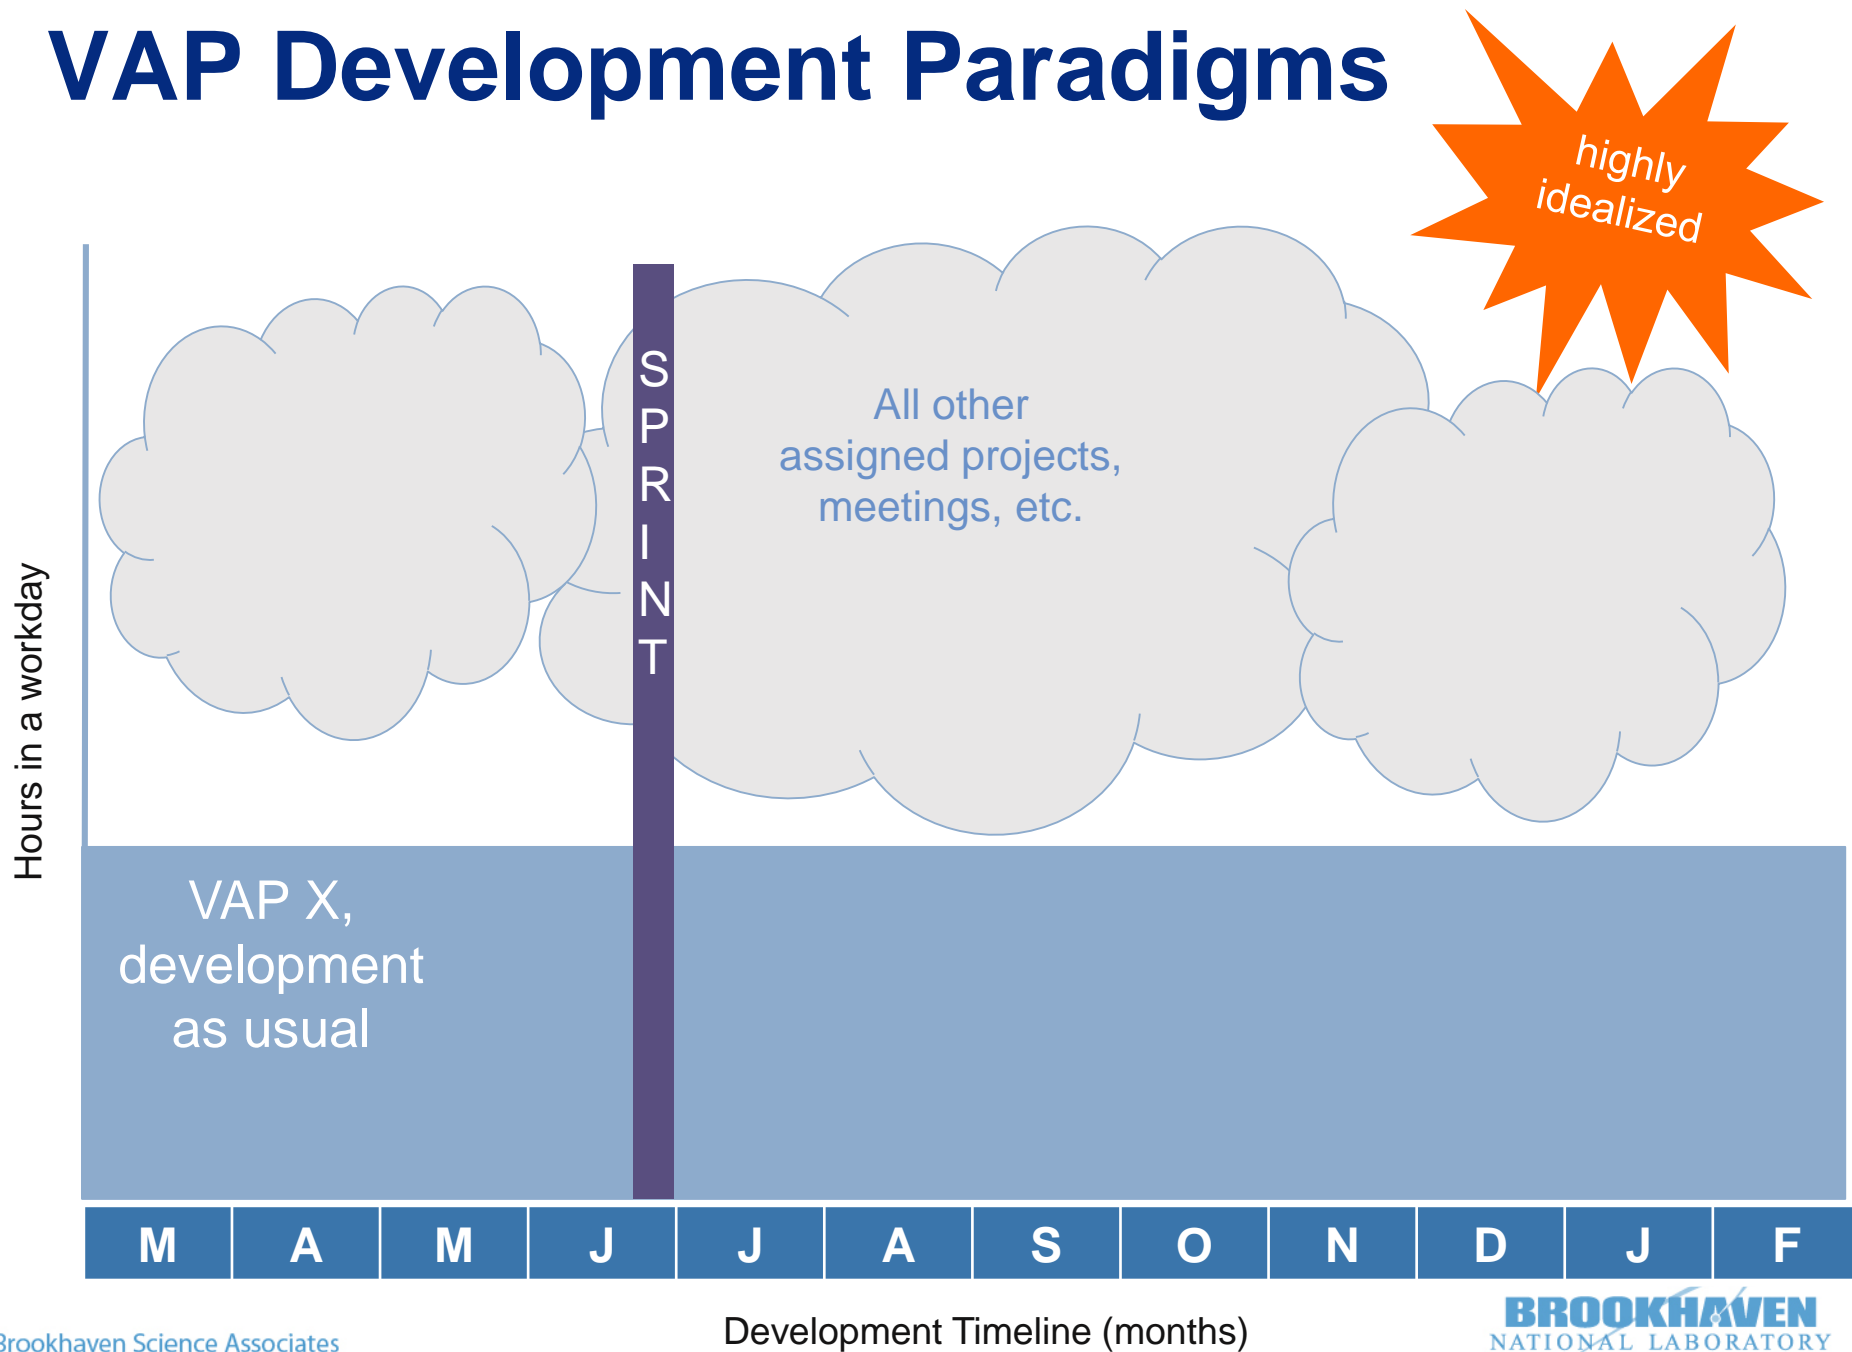

Post-sprint issues and tasks

Post-sprint remaining work / issues	Resulting tasks
Need more than a 'case study'	Process data for Evaluation dataset
Data oddities, quirks	Analyze, add code to resolve
Code runs too slowly	Analyze, and recode for speed
Output must meet ARM standards	Modify output formats, reprocess
DQRs belatedly discovered	Modify codes to handle or omit data
Competing work priorities	Context switching
etc.	etc.

Recommendations for future sprints

■ Thoughtful selection of sprint target products

- Mature codes (tested extensively, on diverse data)
- High impact potential
- Select within context of ARM VAP priorities
- Consider ease of creating official ARM VAP

■ More pre-sprint work

- Literature reviewed by developer
- Implementation plan developed
- Code previewed by developer
- Input data quality reviewed

■ Science lead commitment, post-sprint

- Consult on issues if needed
- Review results prior to evaluation release
