Mean of  $\Omega_T(S)$  minus  $\Omega_T(W)$ : Average across eight 'best' models

(Koster et al. 2006)

# The hypothesis

Heavy rain

In subsequent no-rain days

Less solar radiation  
&  
lower temperature

Light rain

In subsequent no-rain days

More solar radiation  
&  
Higher temperature

# Summary

- **Models underestimate precipitation over the SGP, especially strong precipitation from events such as MCS**
- **Precipitation events cool the surface**
- **Clouds following the precipitation events seem to play the largest role in the cooling in the subsequent days.**
