Arctic Leading Global Change

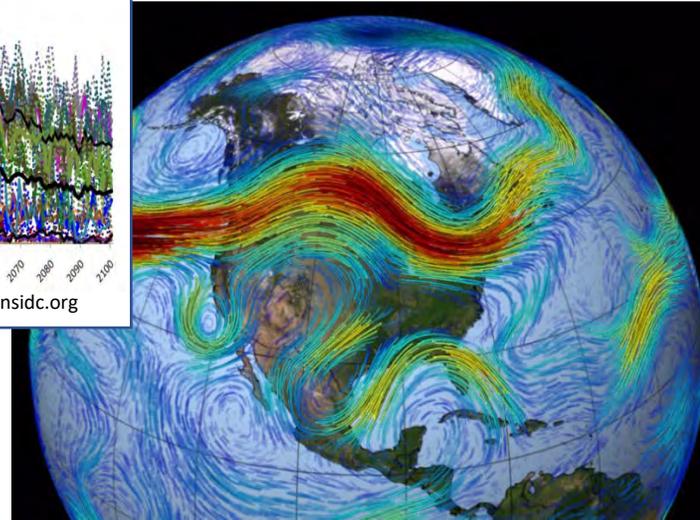

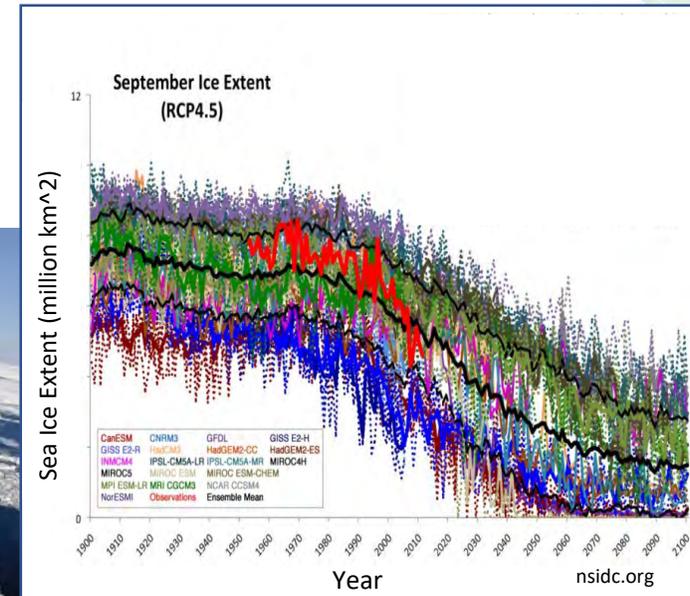

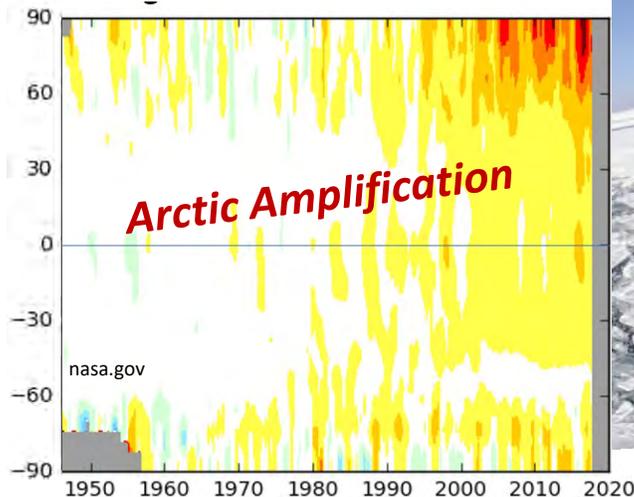

-4,0 -2,0 -1,0 -0,5 -0,2 0,2 0,5 1,0 2,0 4,0

Temperature Change, 1970 to 2017, °C

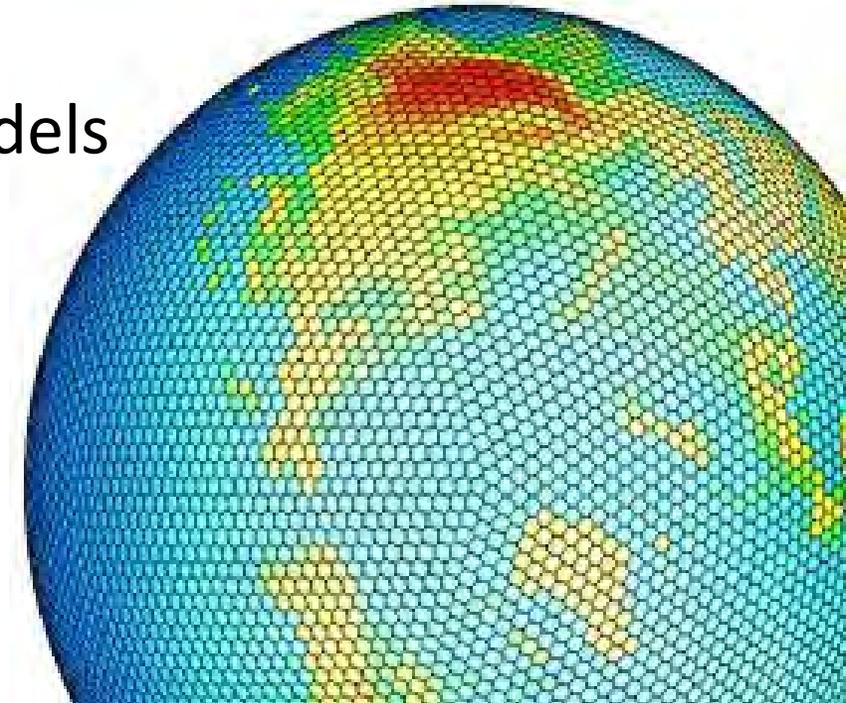

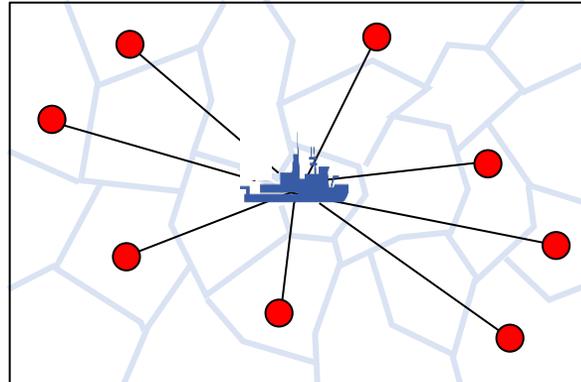

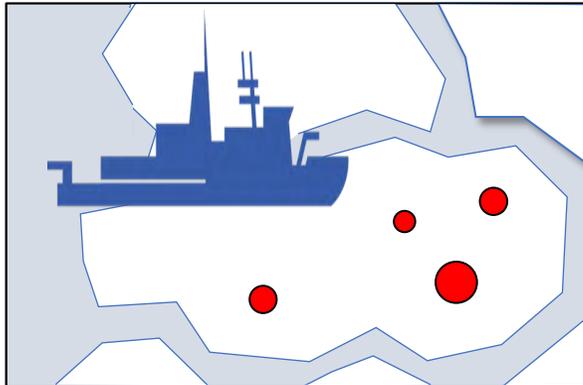

Motivations

- Rapid change: sea-ice decline, amplification, ecosys.
- Poor model predictive capabilities
- Emerging operational/management needs
- Questions about global linkages
- Dearth of observations

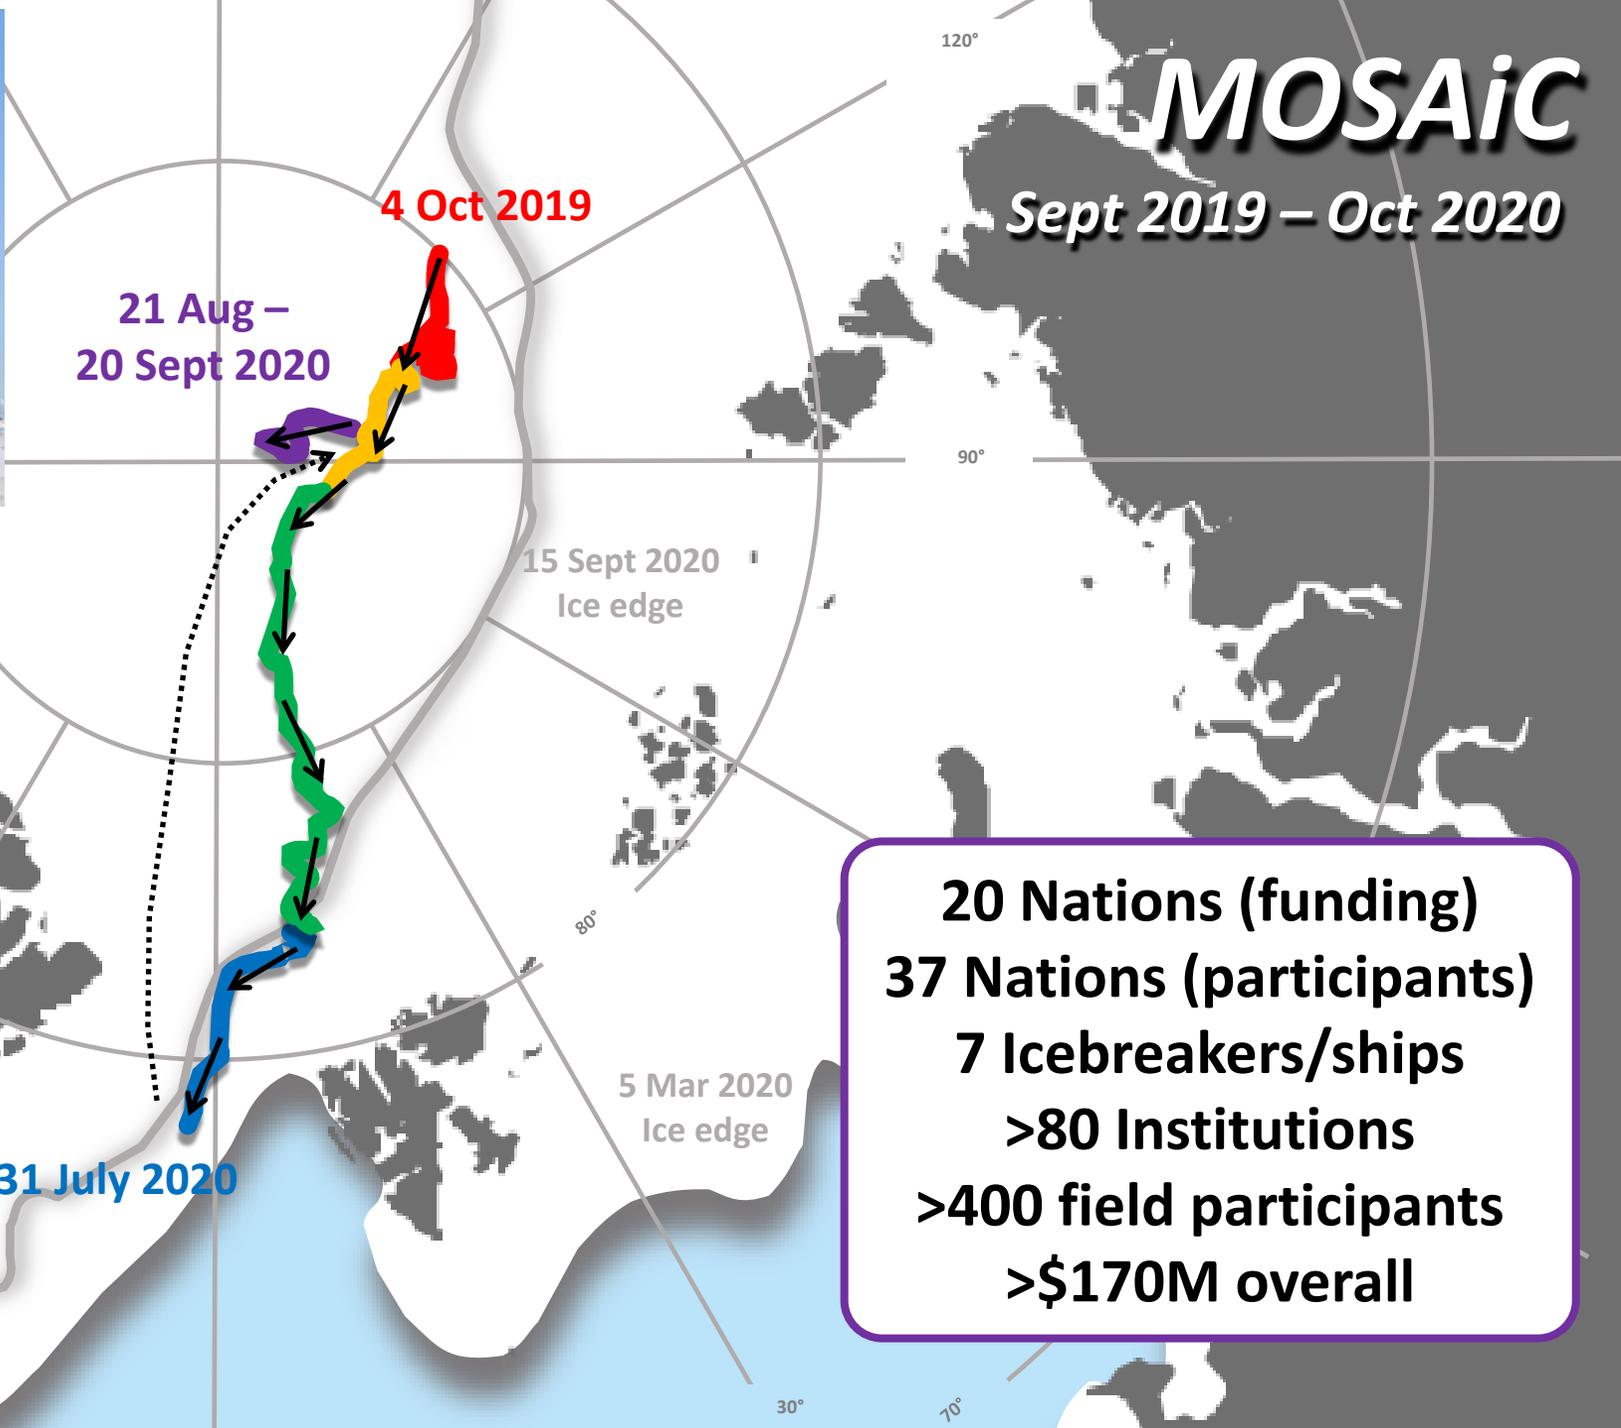

Plans for an Expedition

- International: 12 years of planning!
- Interdisciplinary: ATMOS-ICE-OCEAN, physical-chemical-biological
- Multiscale: Point, grid-cell, pan-Arctic
- Integration: Observations and Models
- Annual Cycle: Contiguous seasons in the ice
- Goal: Improve climate, weather, and process models

MOSAIC

Sept 2019 – Oct 2020

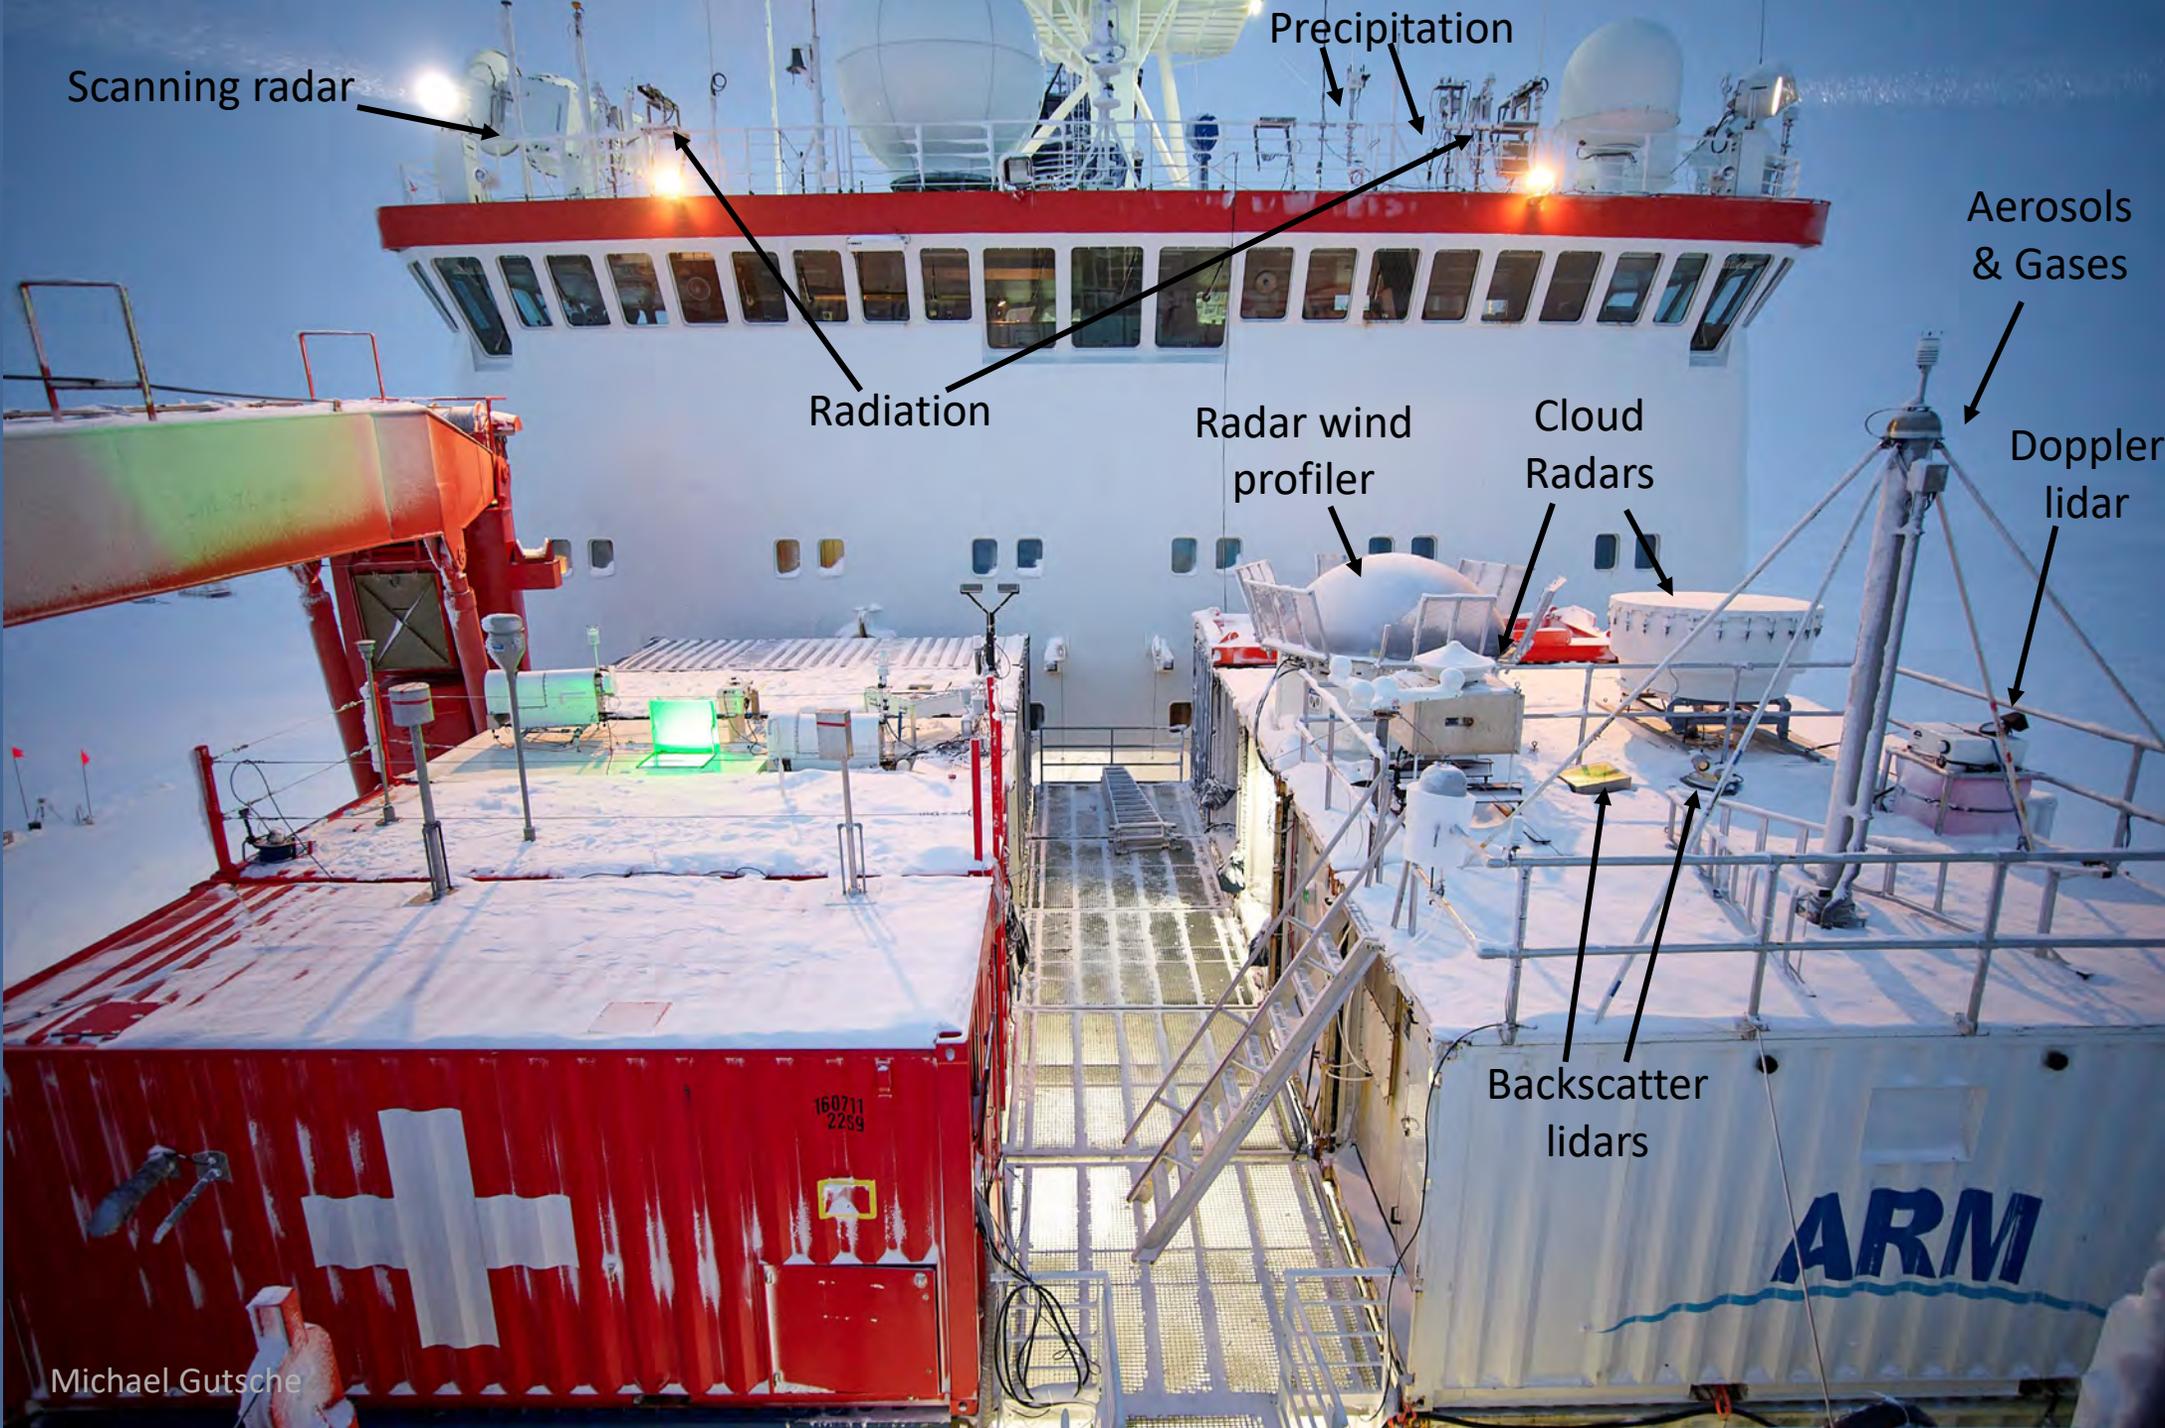

What are the causes & consequences of an evolving & diminished Arctic sea ice cover?

20 Nations (funding)
37 Nations (participants)
7 Icebreakers/ships
>80 Institutions
>400 field participants
>\$170M overall

Polarstern packed to capacity

Scanning radar

Precipitation

Radiation

Radar wind profiler

Cloud Radars

Aerosols & Gases

Doppler lidar

Backscatter lidars

ARM

160711
2259

Entering the sea ice

First exploration of MOSAiC floe

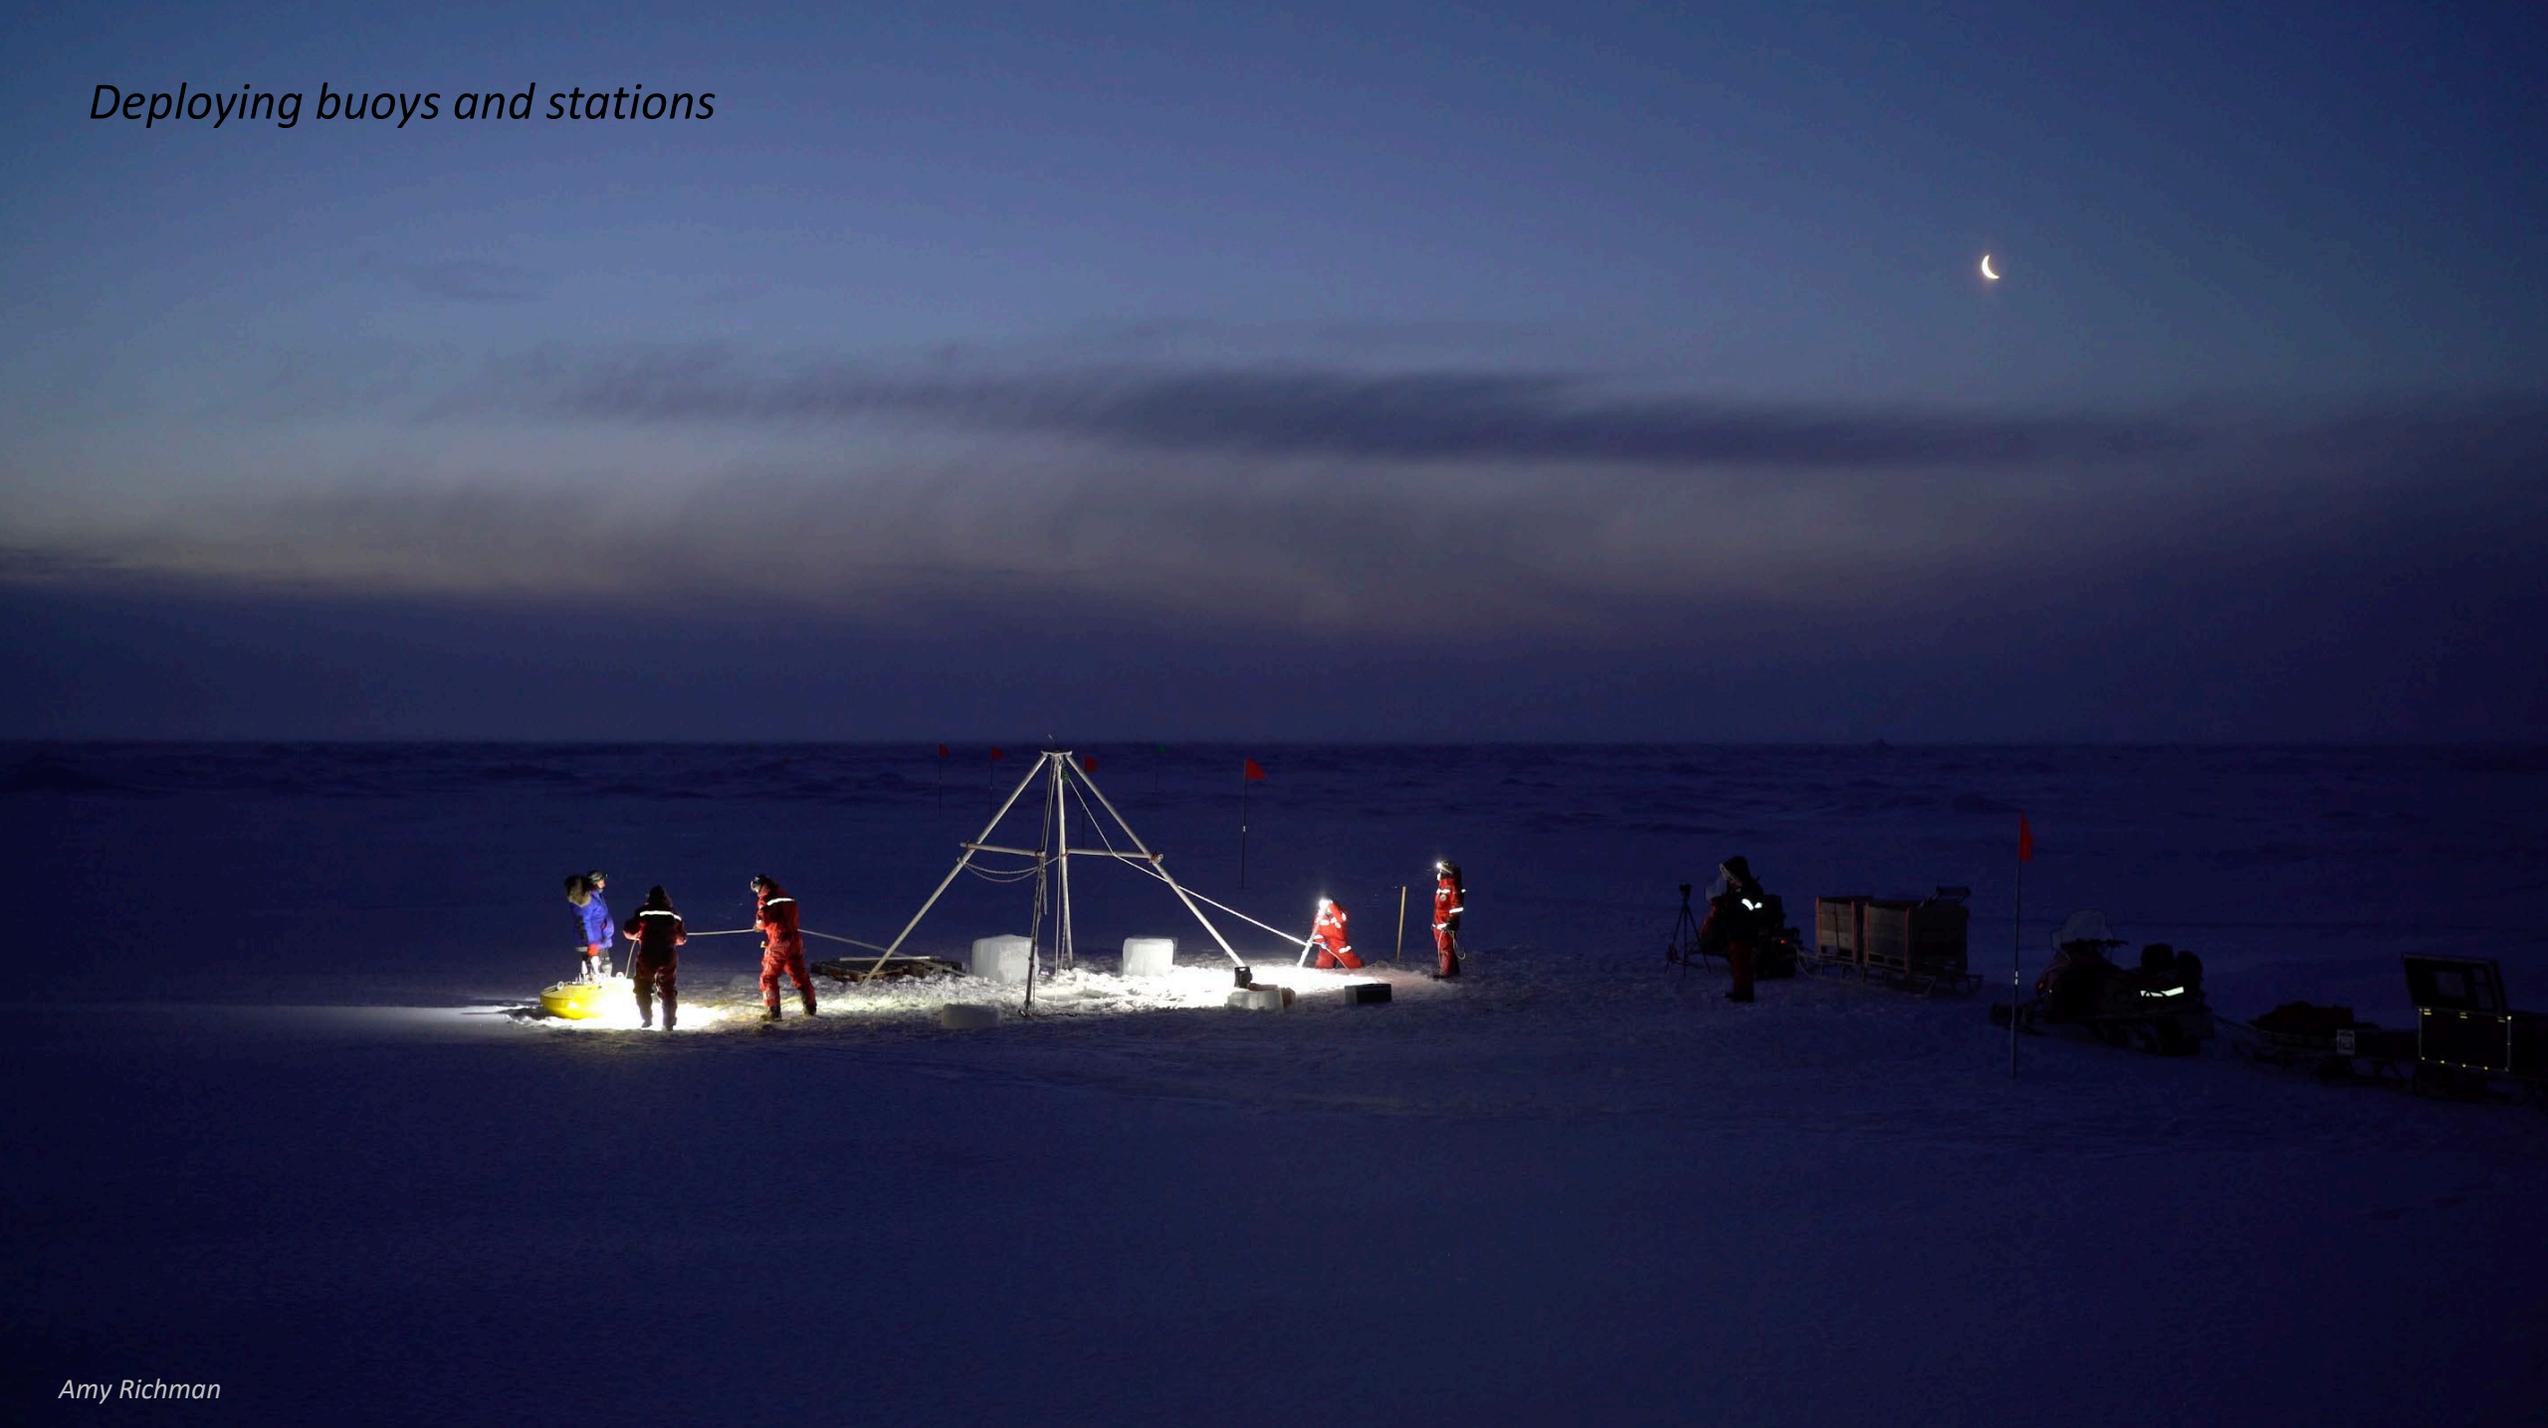

Esther Horvath

Esther Horvath

Deploying buoys and stations

“Cities” on the ice (picture taken mid-day!)

ARM Team

Comprehensive physical measurement and sample programs

Ice dynamics.... early and often

Descent into in to Night

What happens to biology during Polar Night?

MOSAIC Floe 2.0

Adventures in field operations

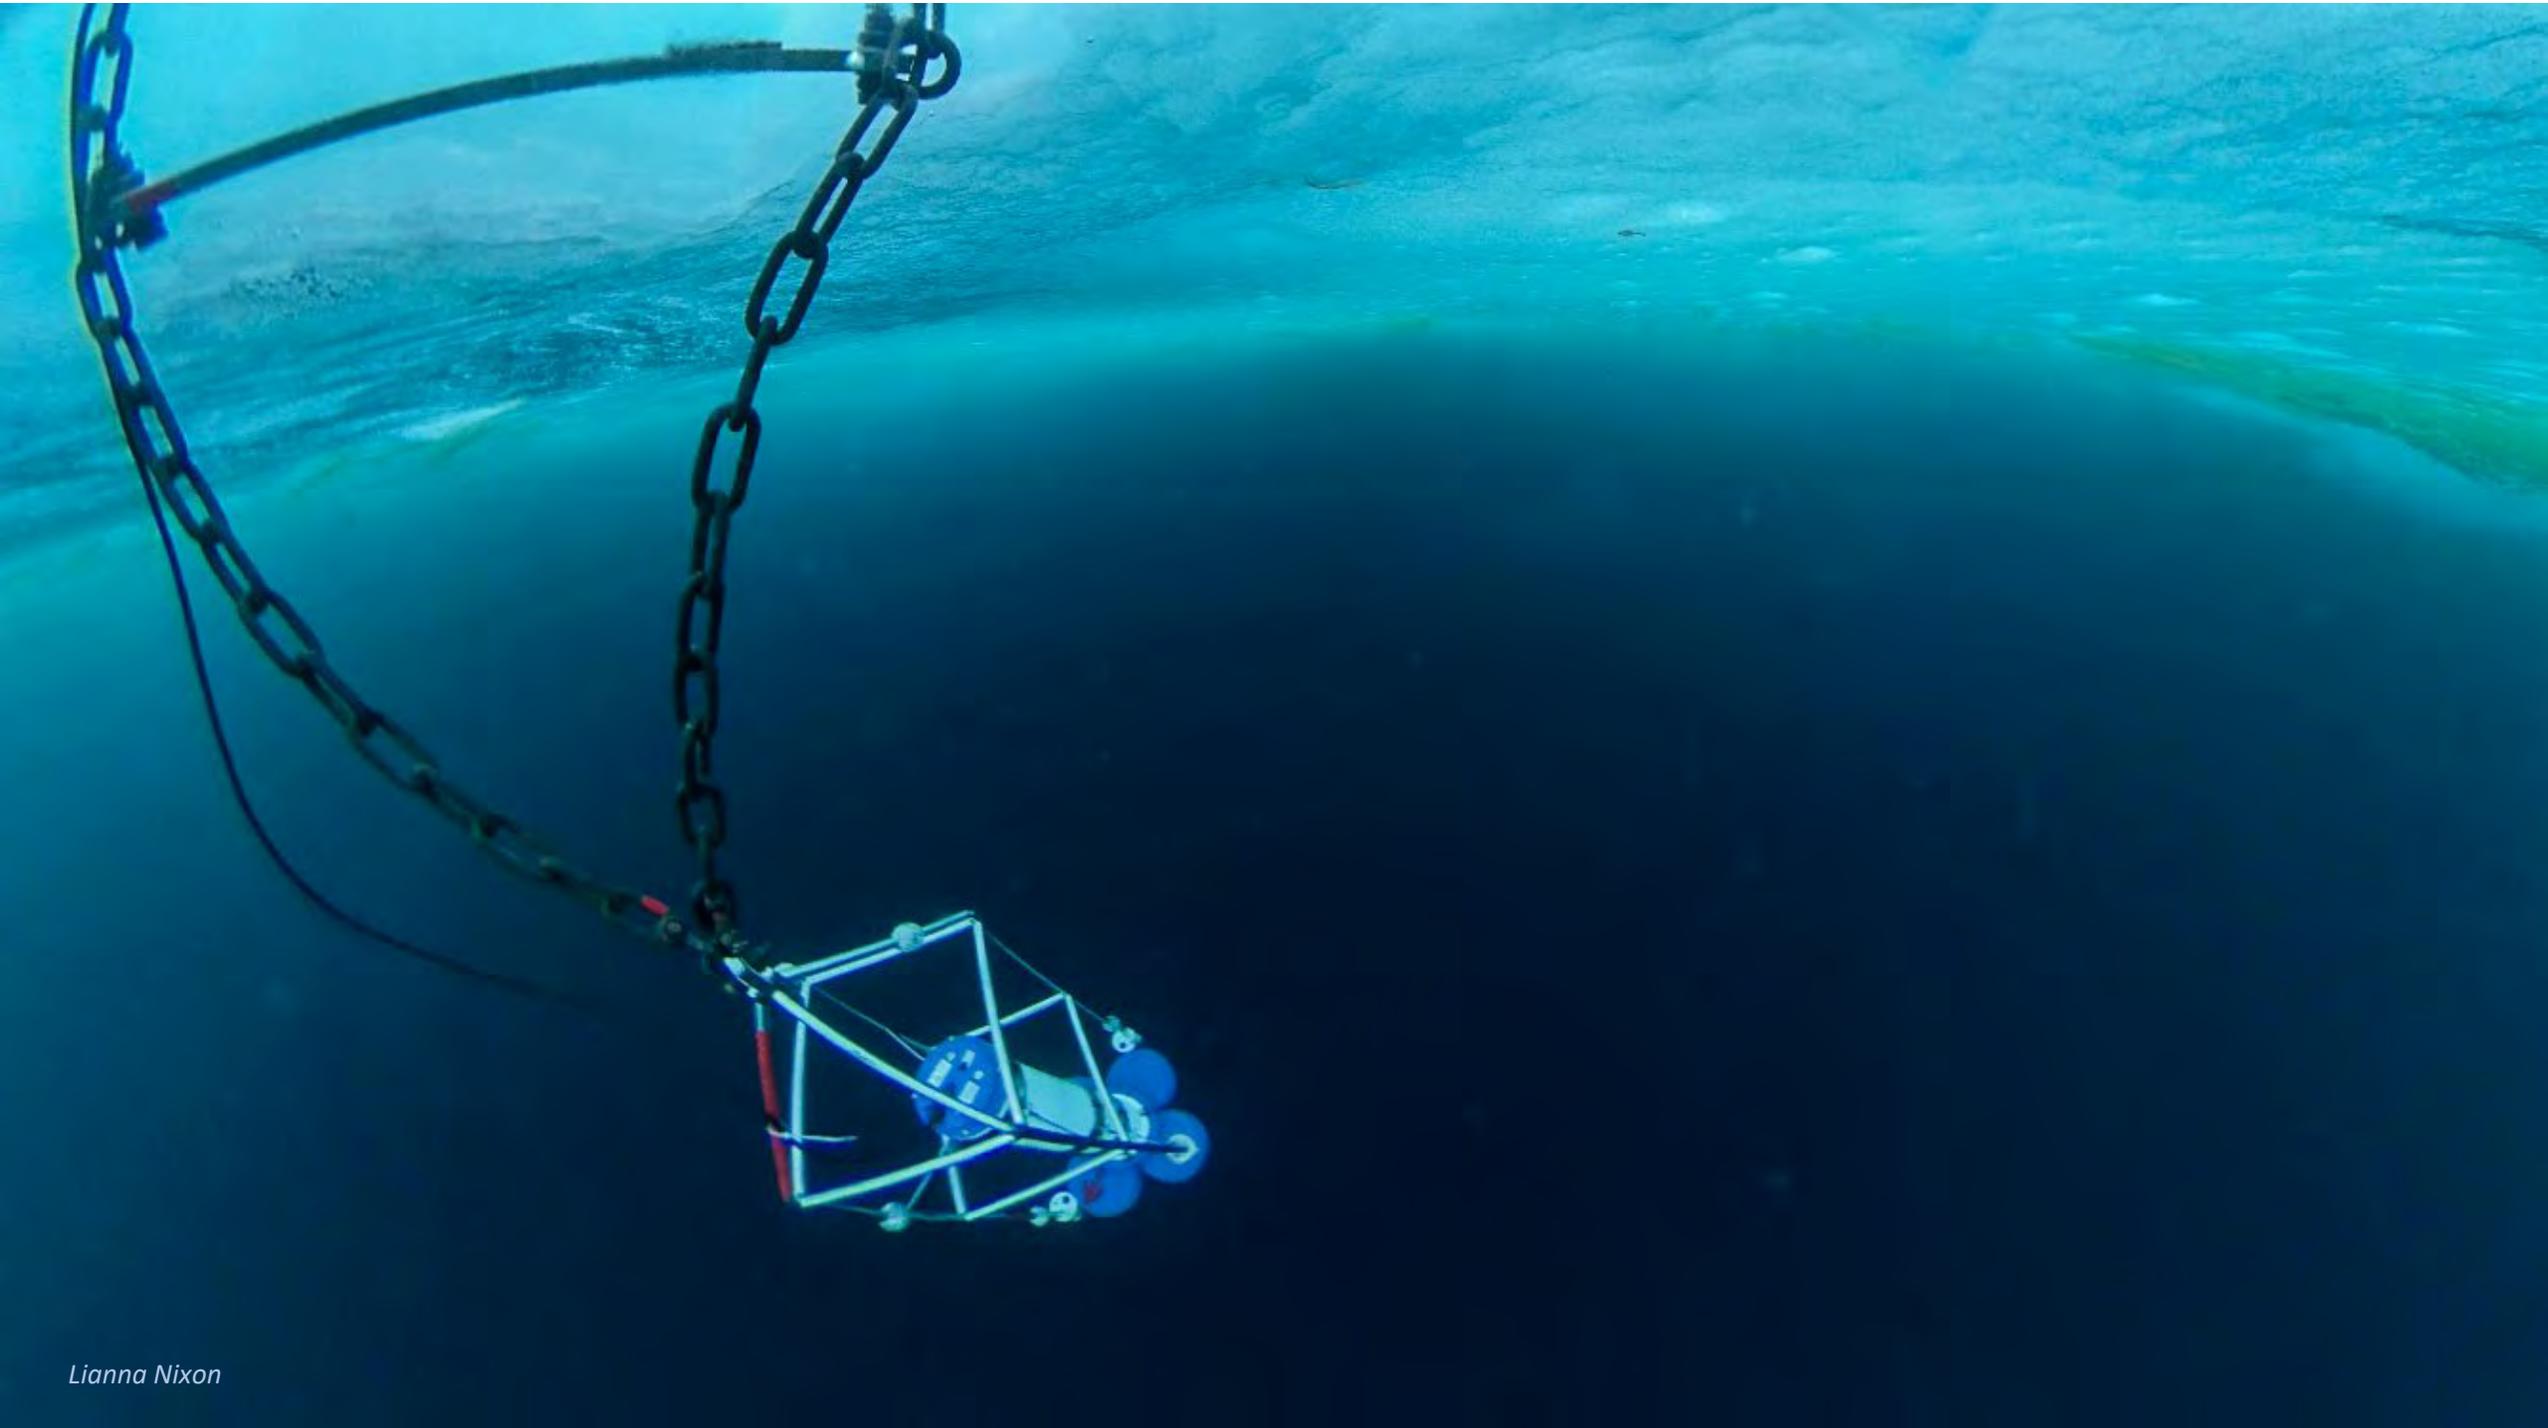

Lianna Nixon

Getting ready to freeze in....

Michael Gallagher

Information to improve satellite techniques

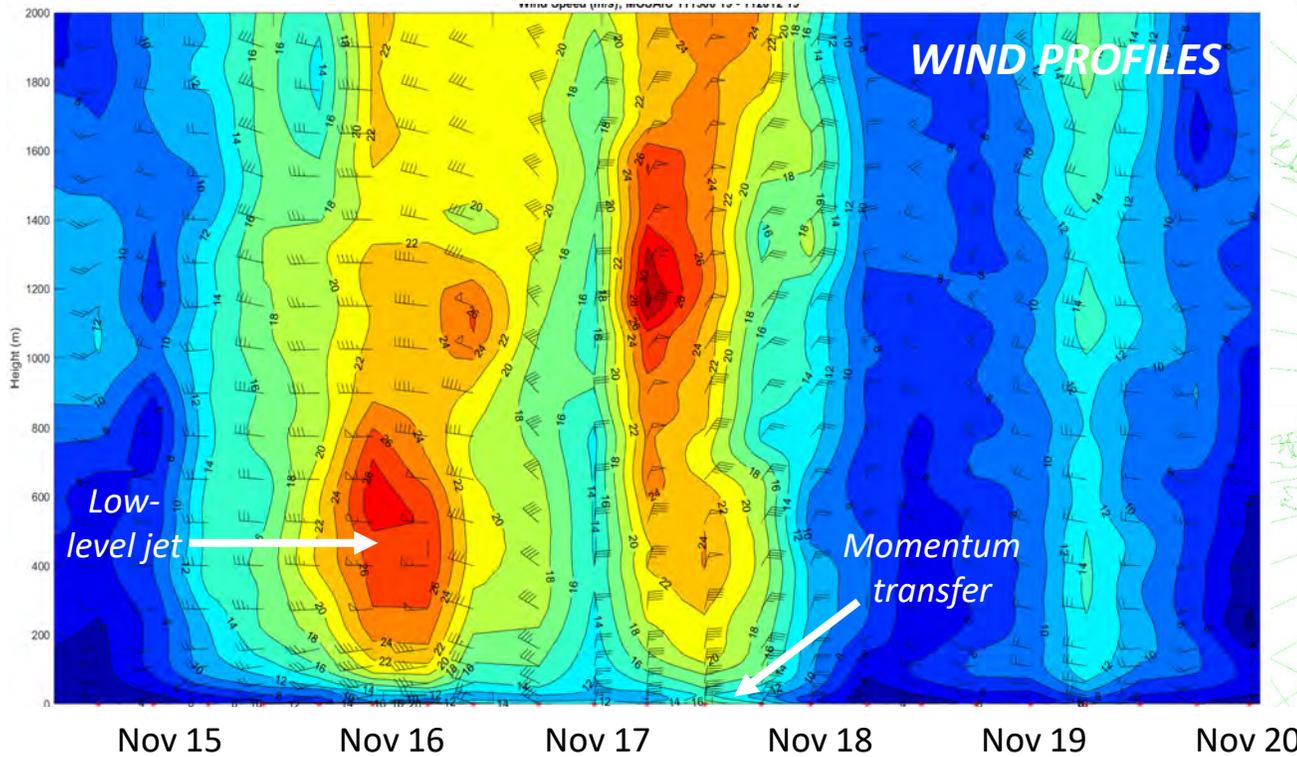

AMF in action!

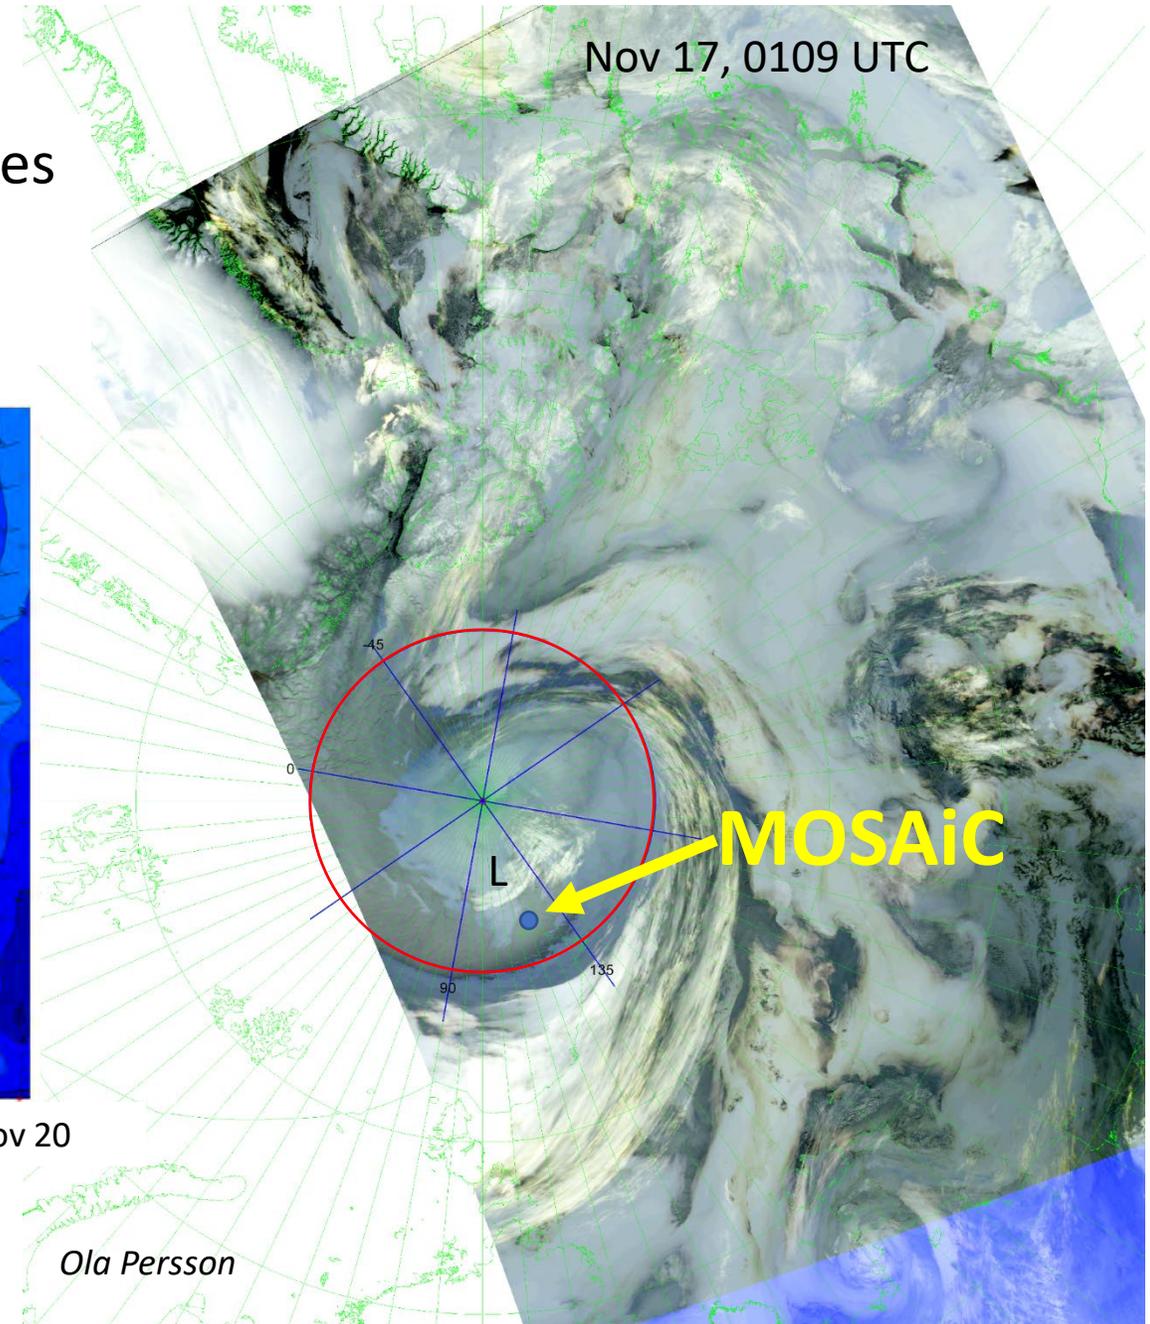

Arctic Cyclones

- different structure/evolution than at mid-latitudes
- important impacts on the sea ice & upper ocean
- ~20 cyclones impacted MOSAIC

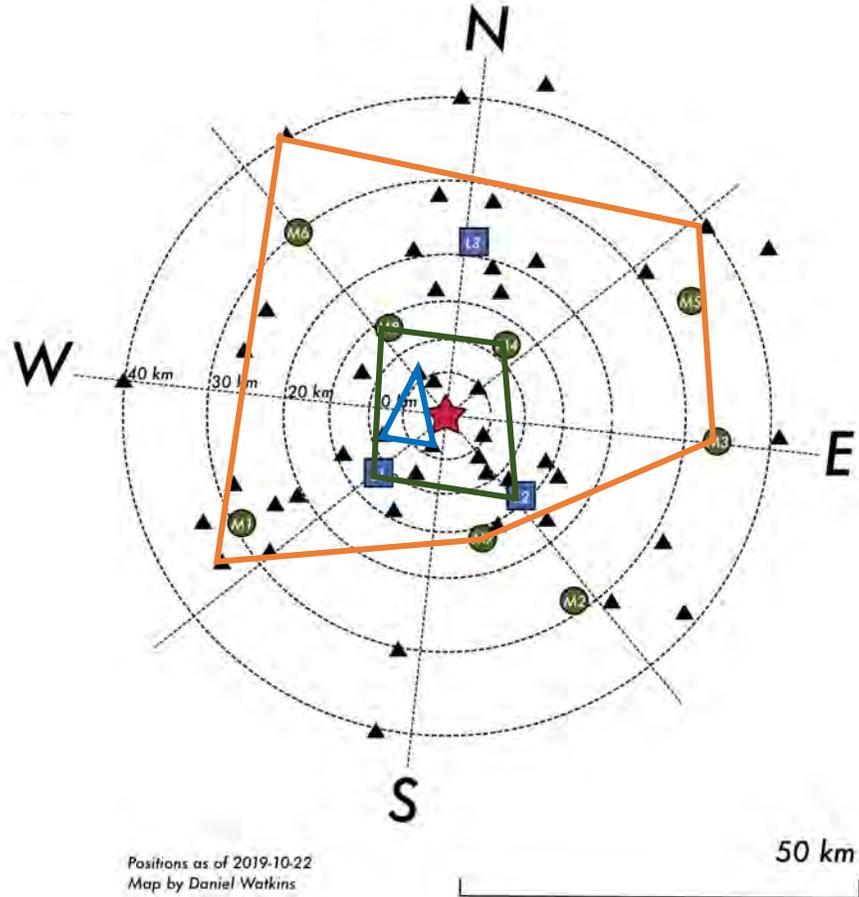

Detailed wind, divergence, and momentum analysis

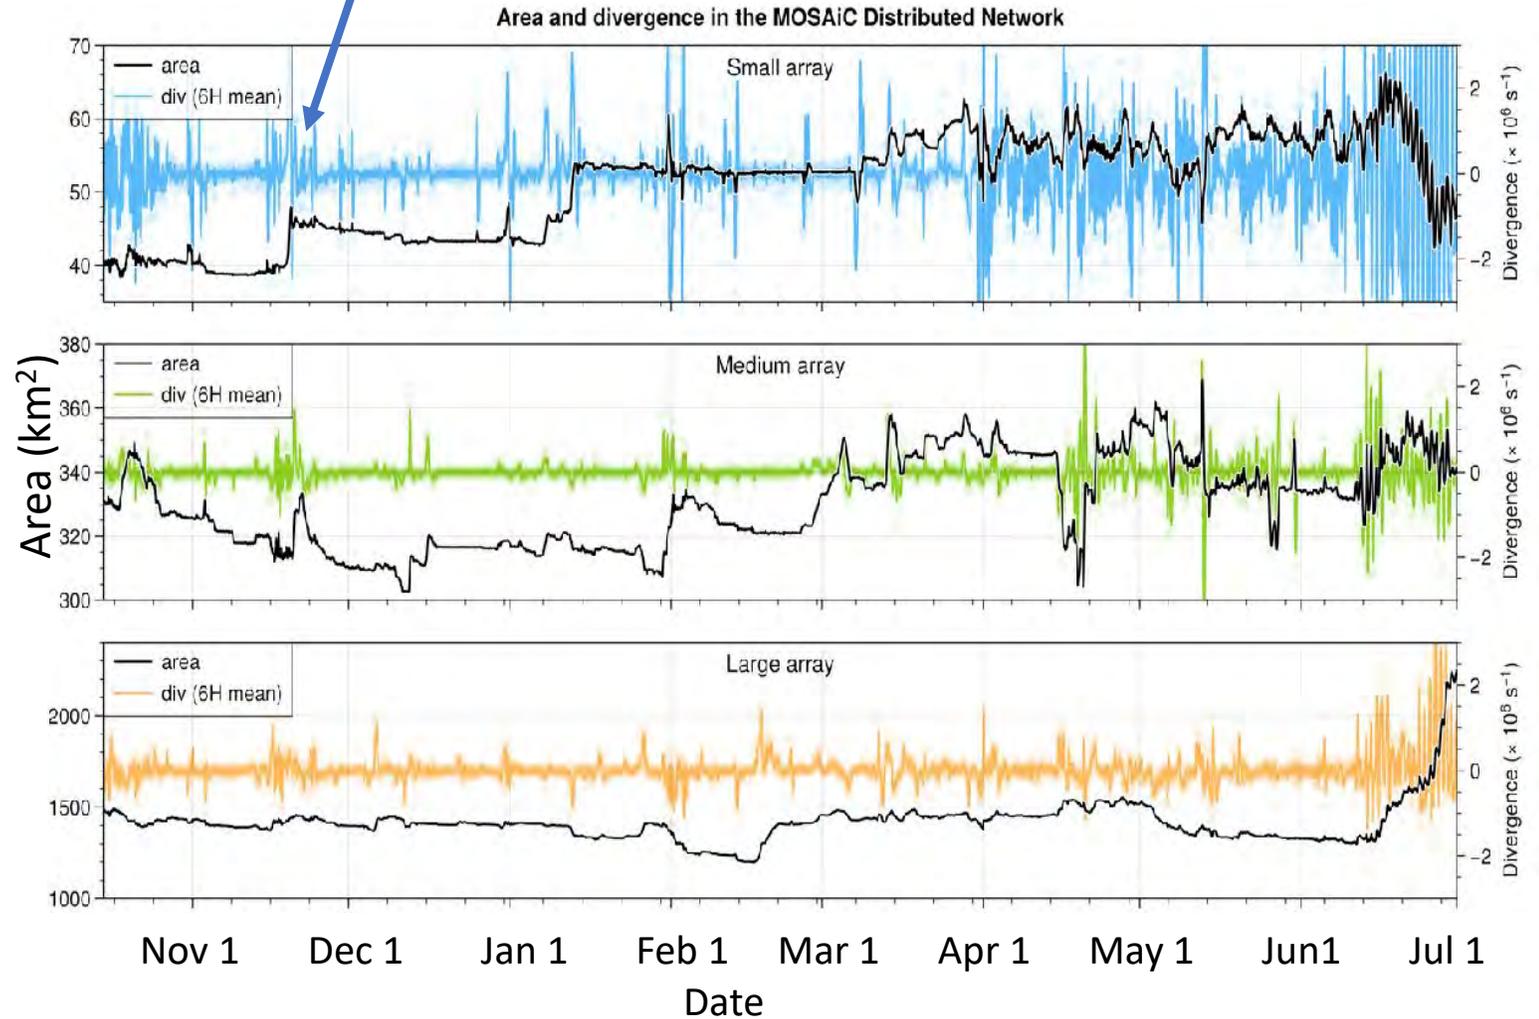

Sea Ice Dynamics

MOSAiC Distributed Network

Daniel Watkins & Jenny Hutchings

Strong deformation

Multi-scale ice dynamics essential for improved model representation.

Cloud Impact on Ice Thermodynamics

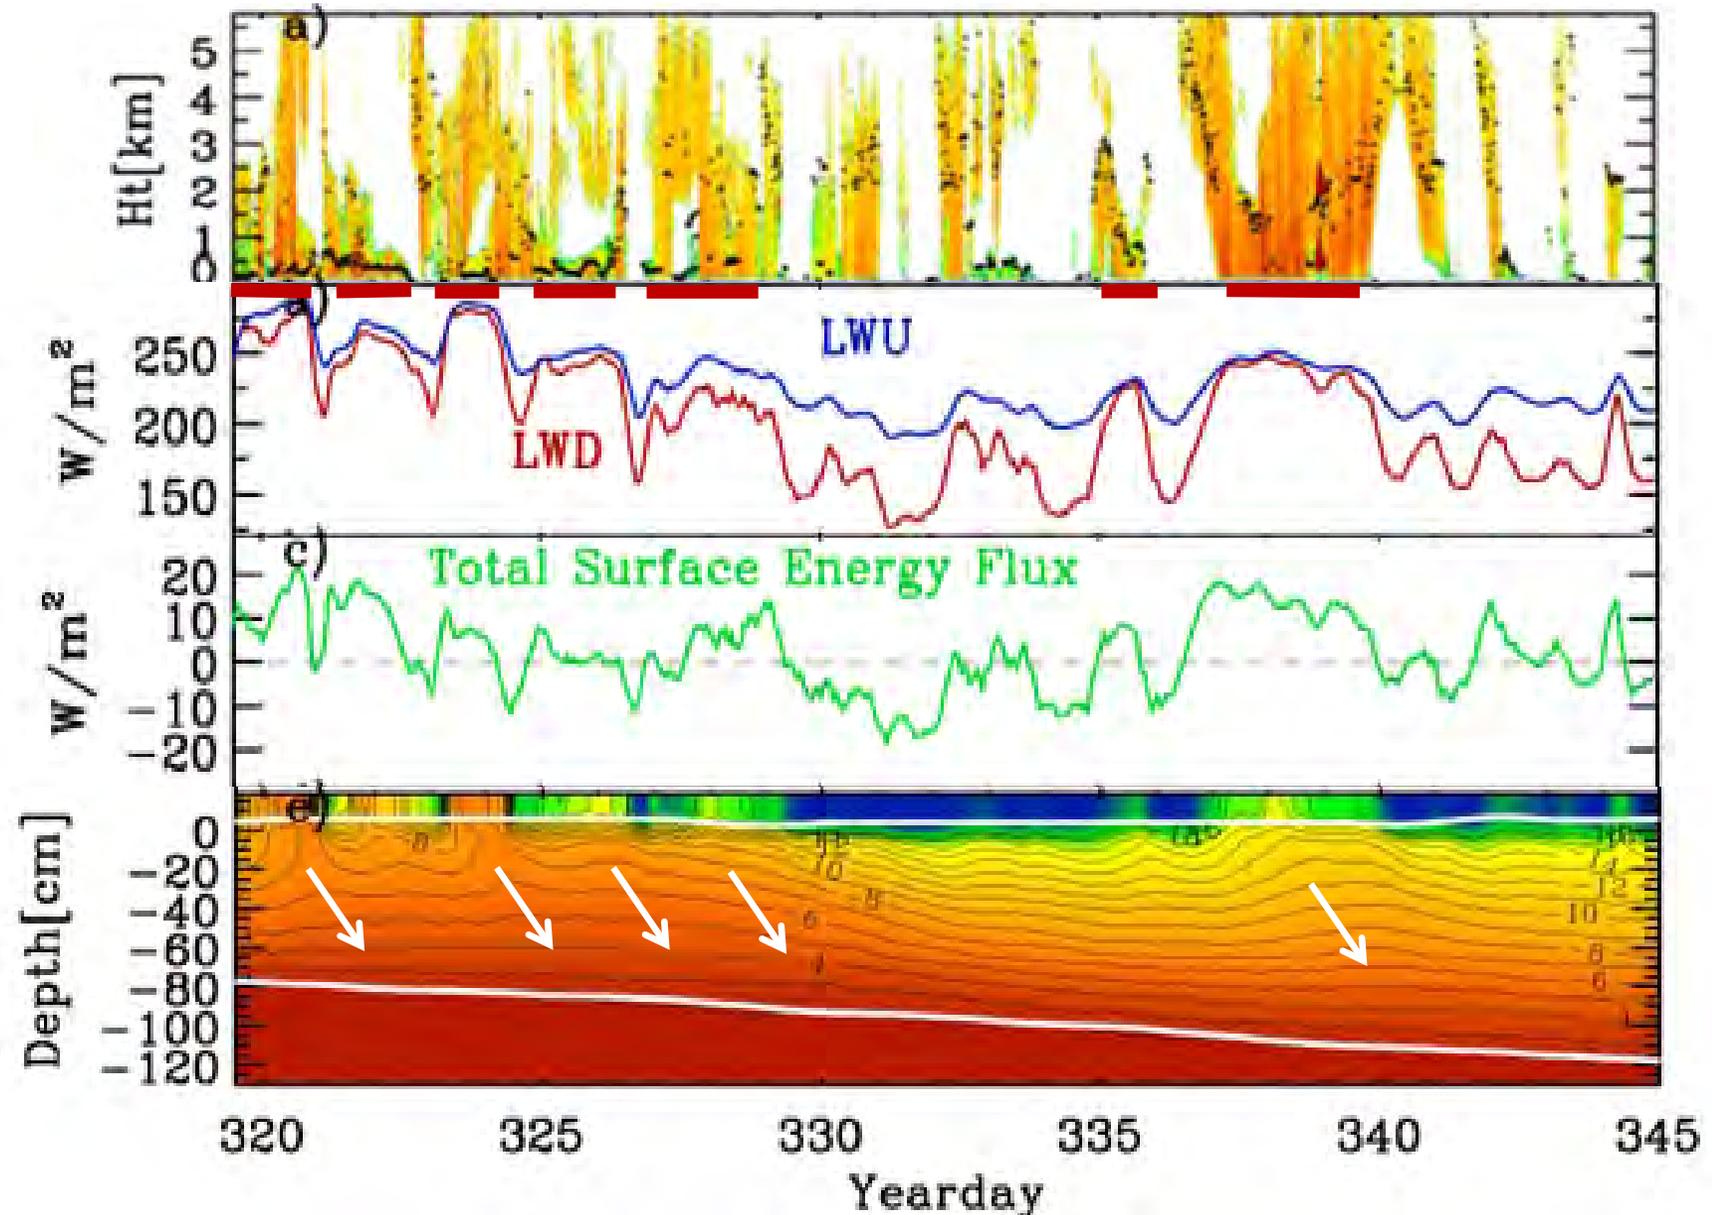

25-day Nov-Dec case study

Radar shows clouds with height
Microwave shows liquid water
(Cloud product available in Archive)

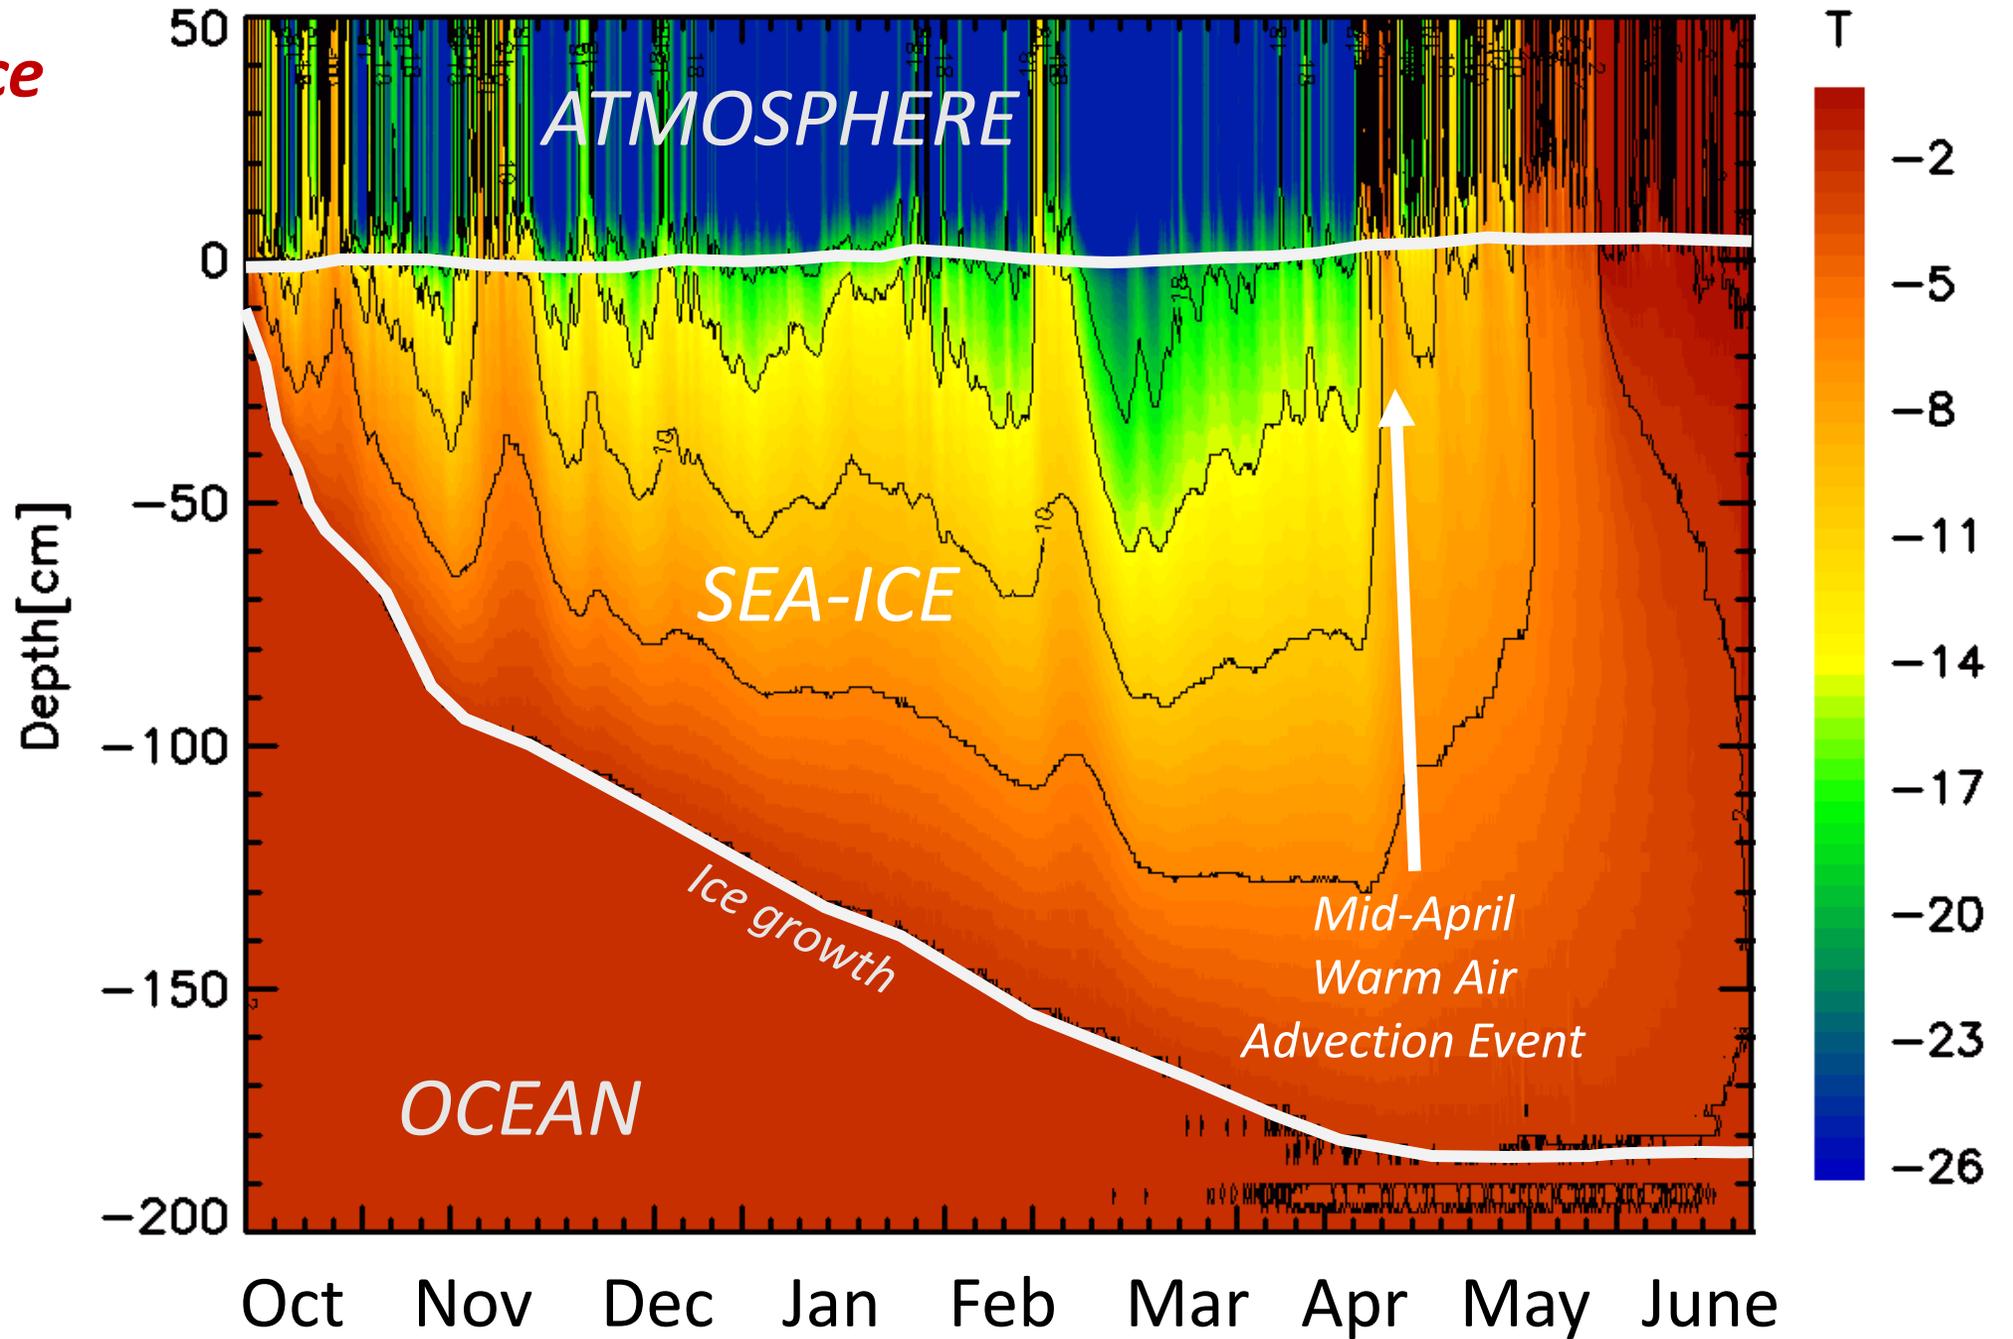

Strong increase in atmospheric
emitted longwave radiation when
liquid clouds are present

Total atmospheric surface flux
strongly driven by LW radiation
from liquid clouds

Cloud-driven variability impacts
sea-ice temperature, conductive
heat flux, and growth

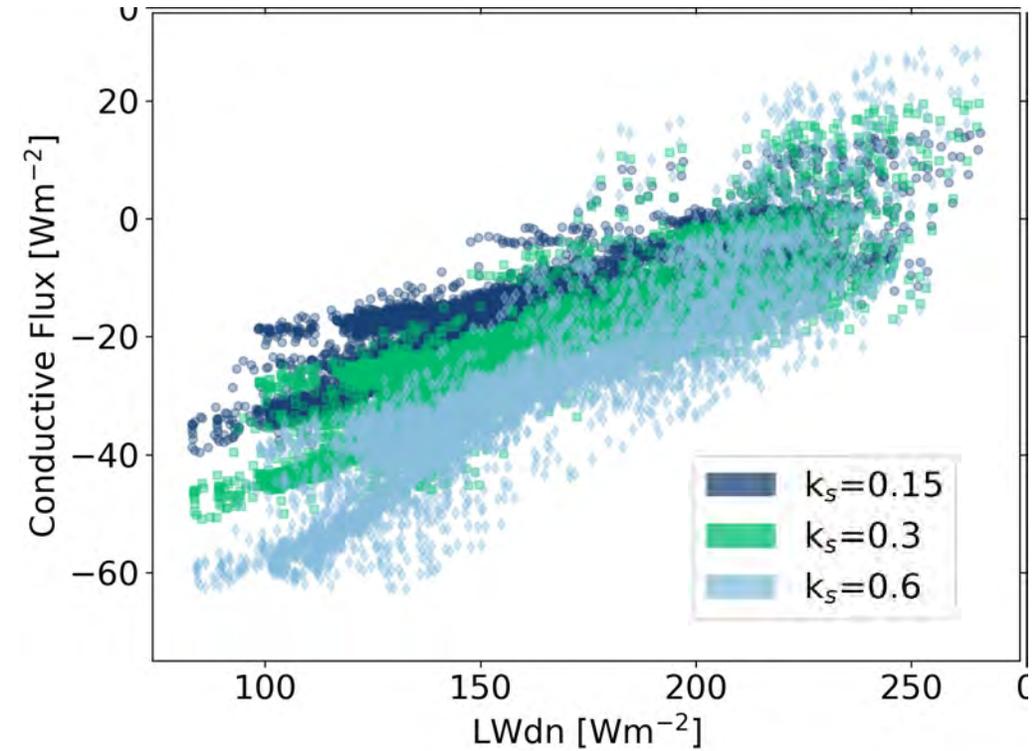

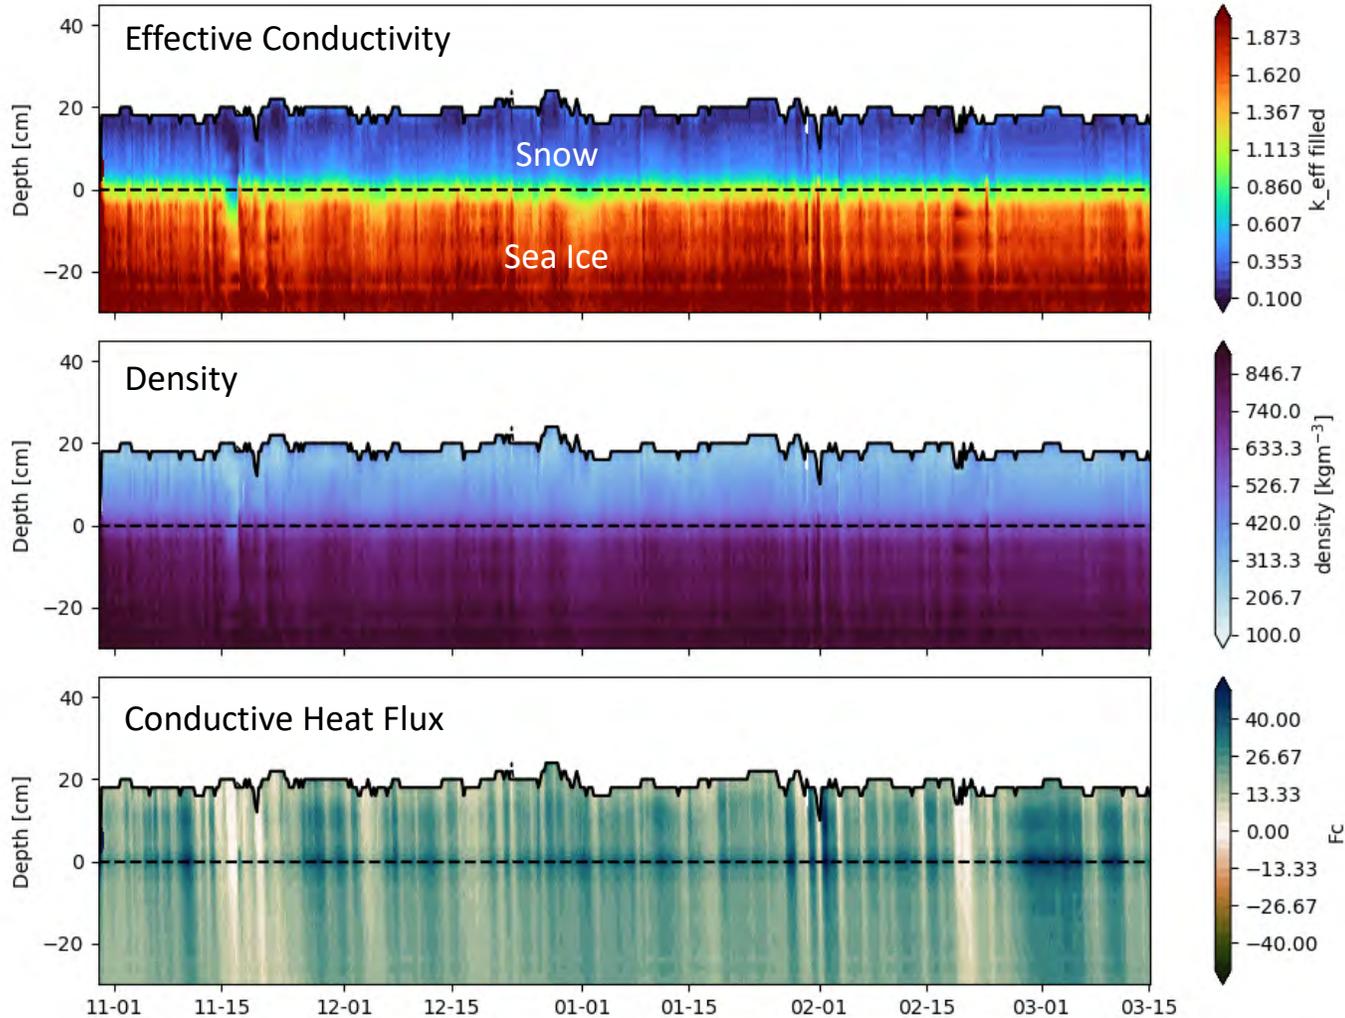

*Towards Ice
Melt*

Thermal Conductivity

Deriving thermal properties from temperature profiles

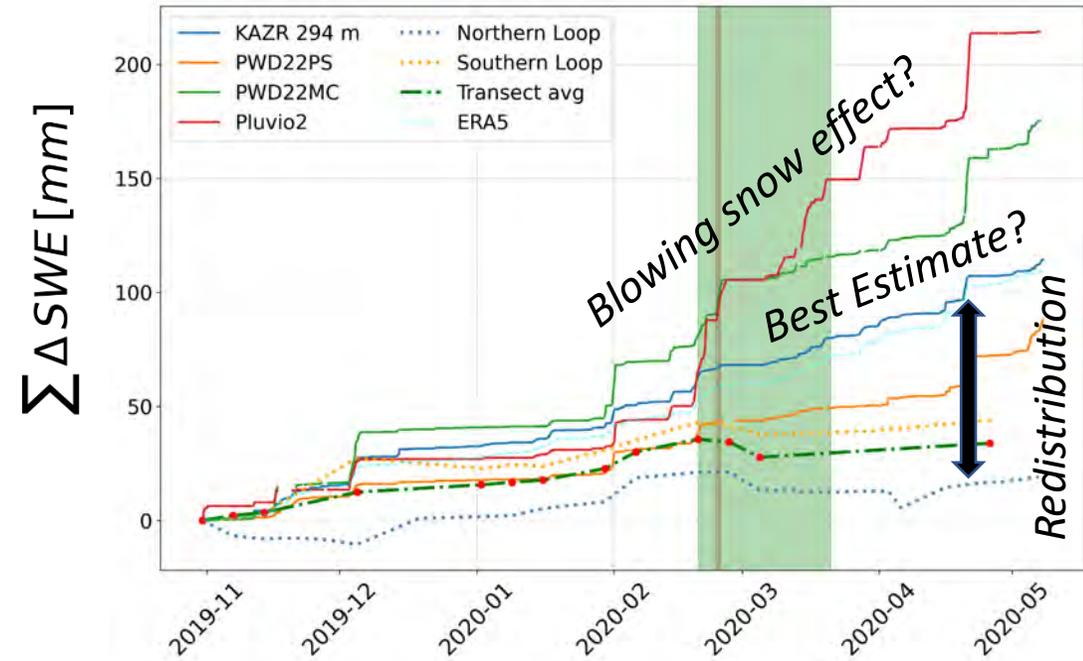

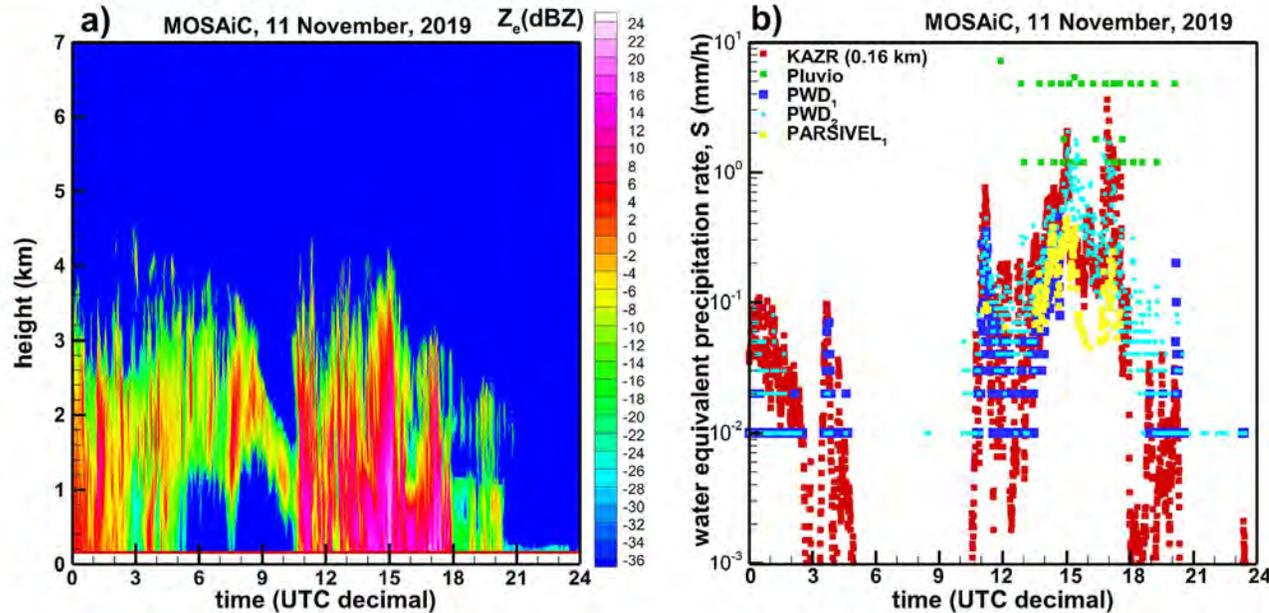

- Can derive time-depth profiles of ice & snow thermal properties
- Balance of SEB terms is sensitive to model-assumed snow conductivity
- MOSAiC info suggests k_s is larger than most models assume

Snowfall and Snow on Ice

An insulator and reflector.....

Wagner et al. 2022

Matrosov et al. 2022

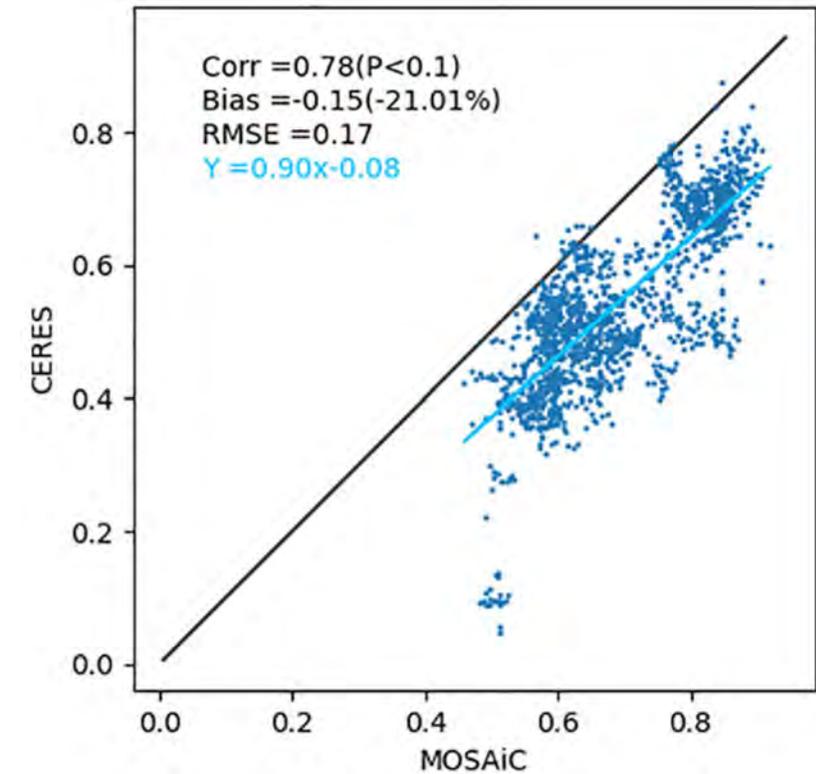

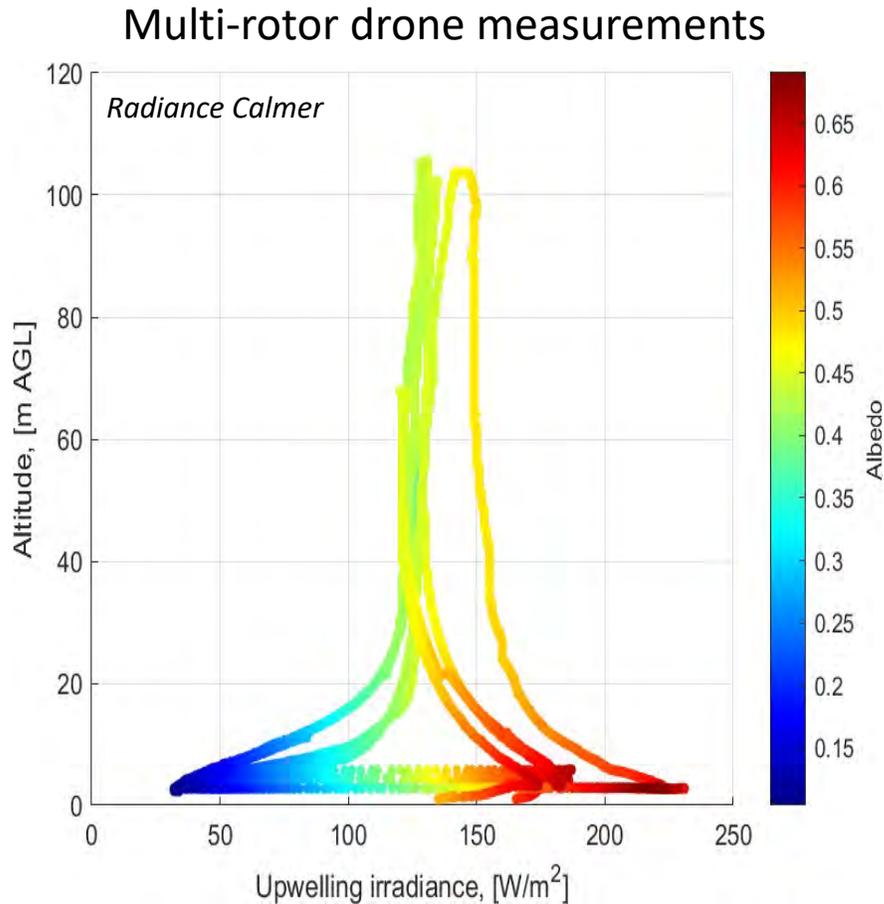

- Comprehensive intercomparisons
- Continuous radar-based estimates of snowfall
- PI Product available in the ARM Archive

- Comparisons with manual measurements
- Differences offer insight into snow redistribution / erosion

Scaling Surface Albedo

Lonardi et al. 2022

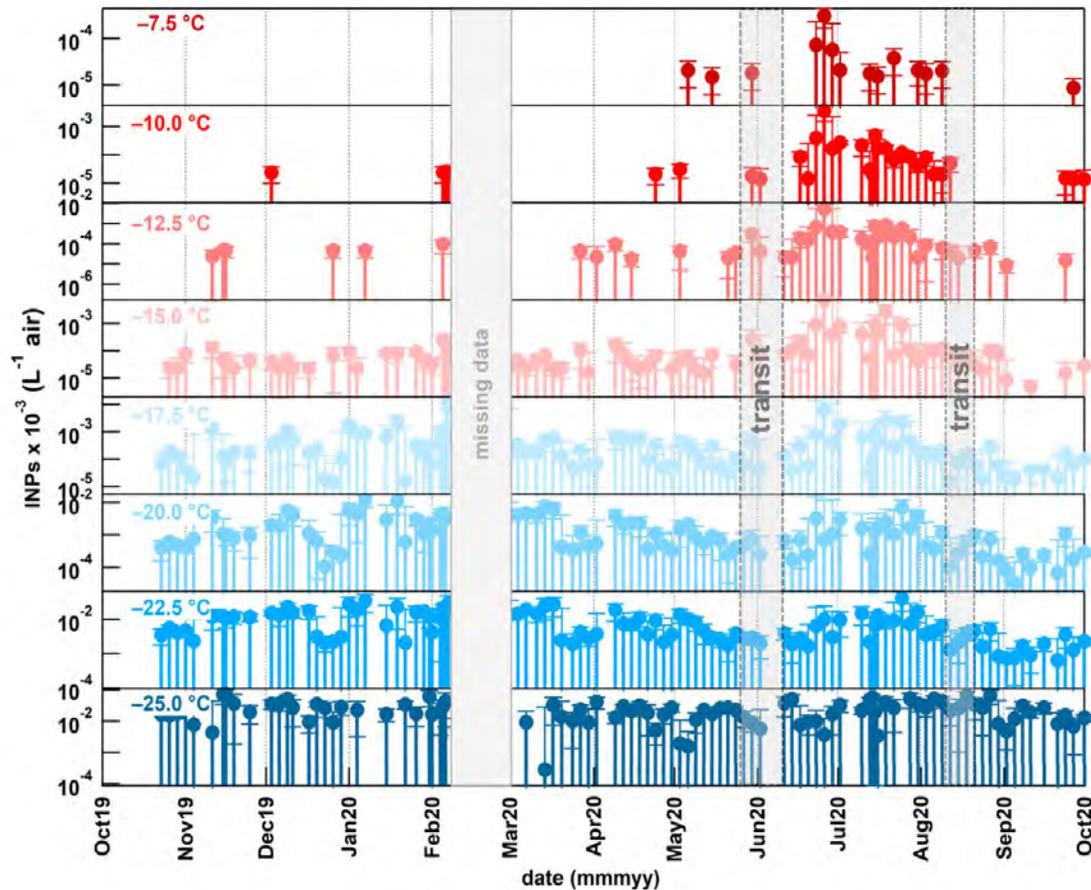

Huang et al. 2022

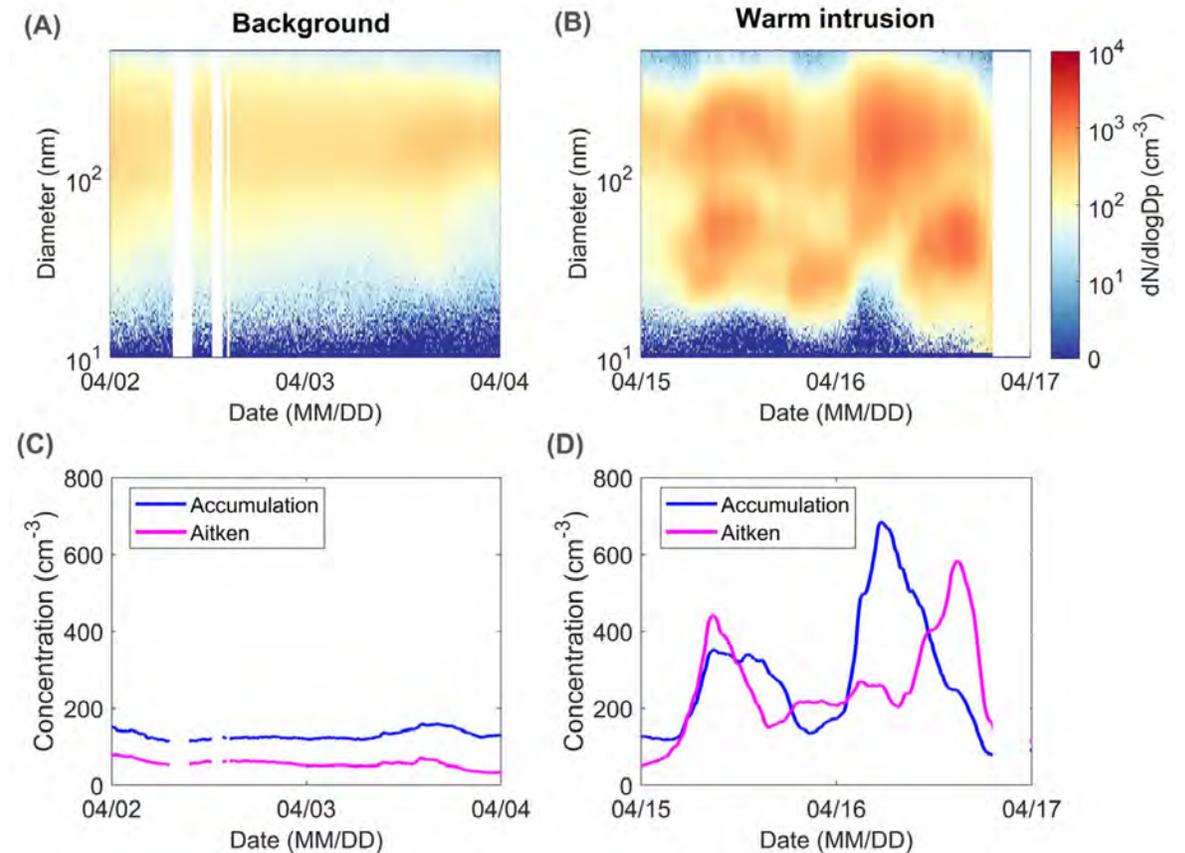

- *Point vs floe vs regional*
- *GNDRAD → Drone → Tethered Balloon → Satellite*
- *Albedo convergence for radiometer view above 40 m altitude*
- *Satellite – ground “bias” related to sea ice concentration*
- *Other papers looking at albedo annual cycle (Light et al. 2022) and surface scattering properties (Smith et al. 2022)*

Aerosols and their variability

- Annual cycle of INPs, including bio sourced
- CCN from blowing snow
- Ultra clean episodes
- Event with city-like pollution
- New particle formation events

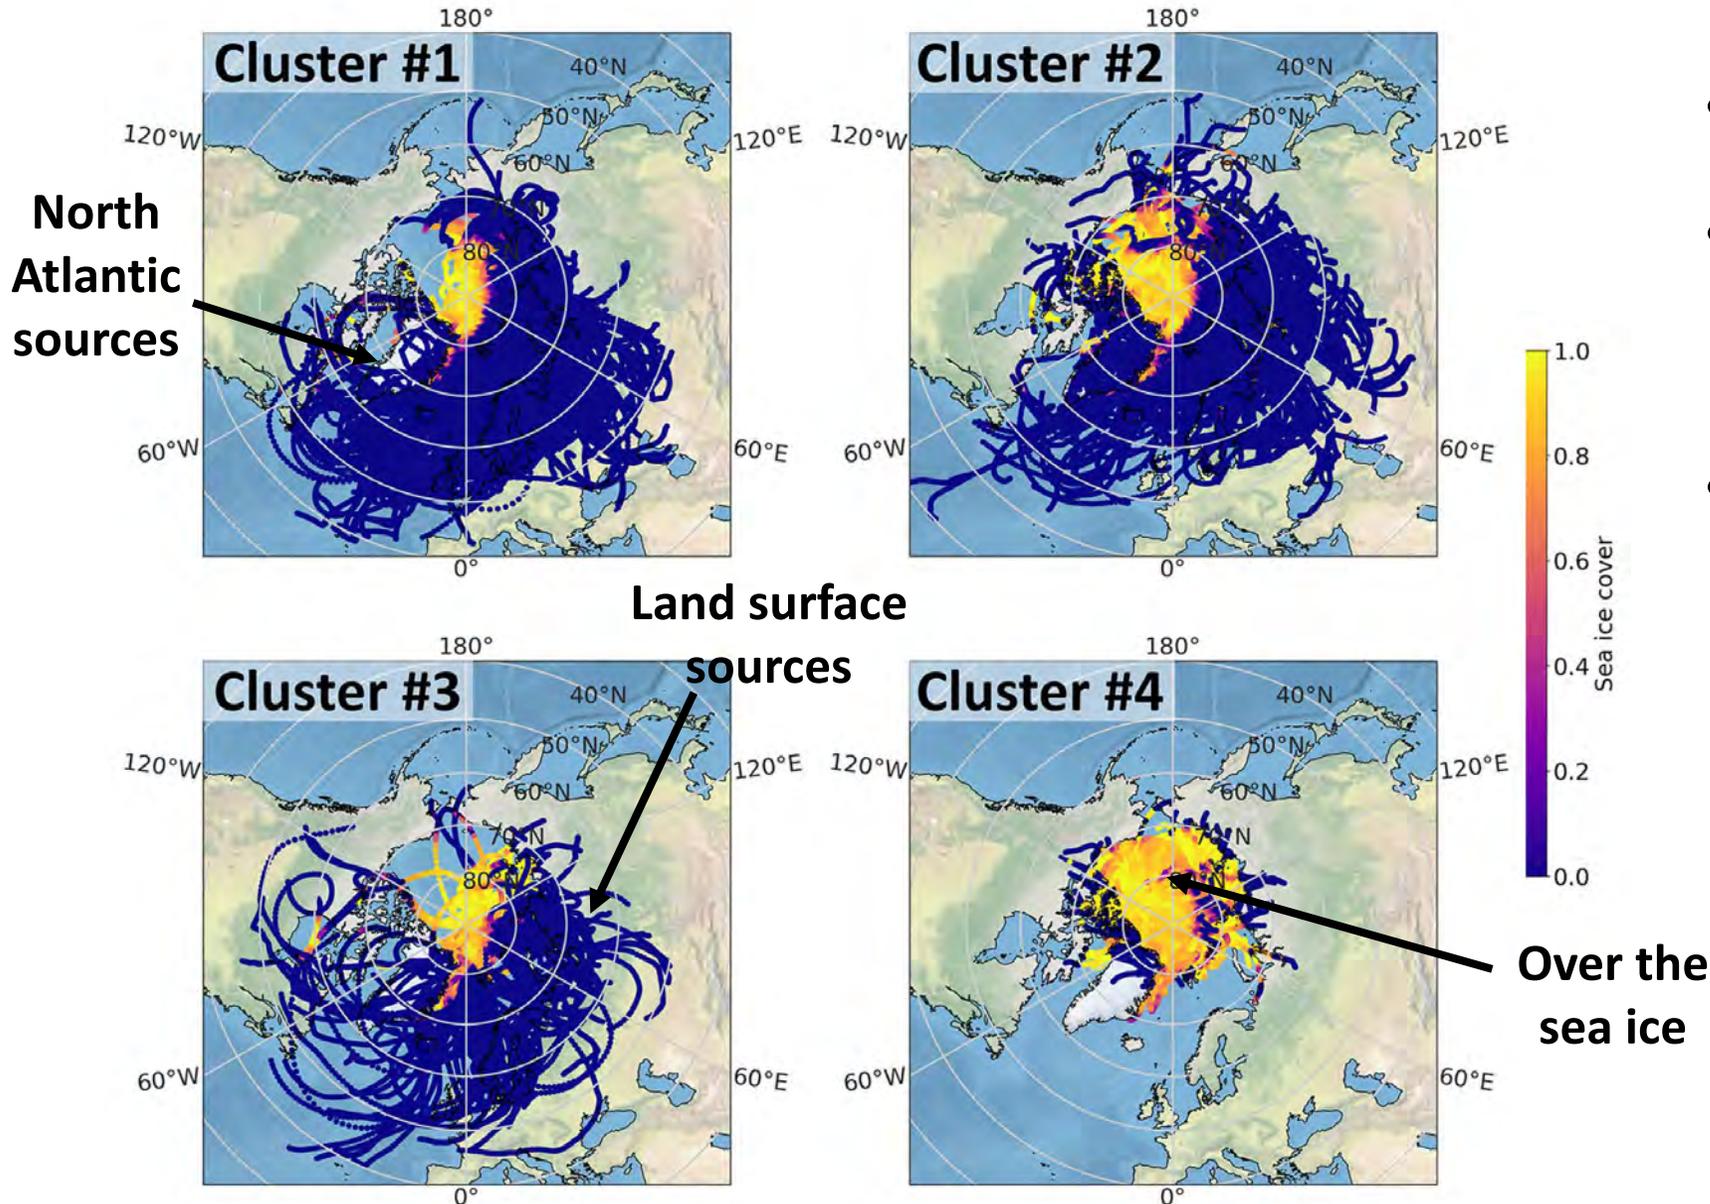

Creamean et al. 2022, Nature Comms.

Dada et al. 2022, Nature Comms.

Liquid Water Cloud Trajectories

Analysis

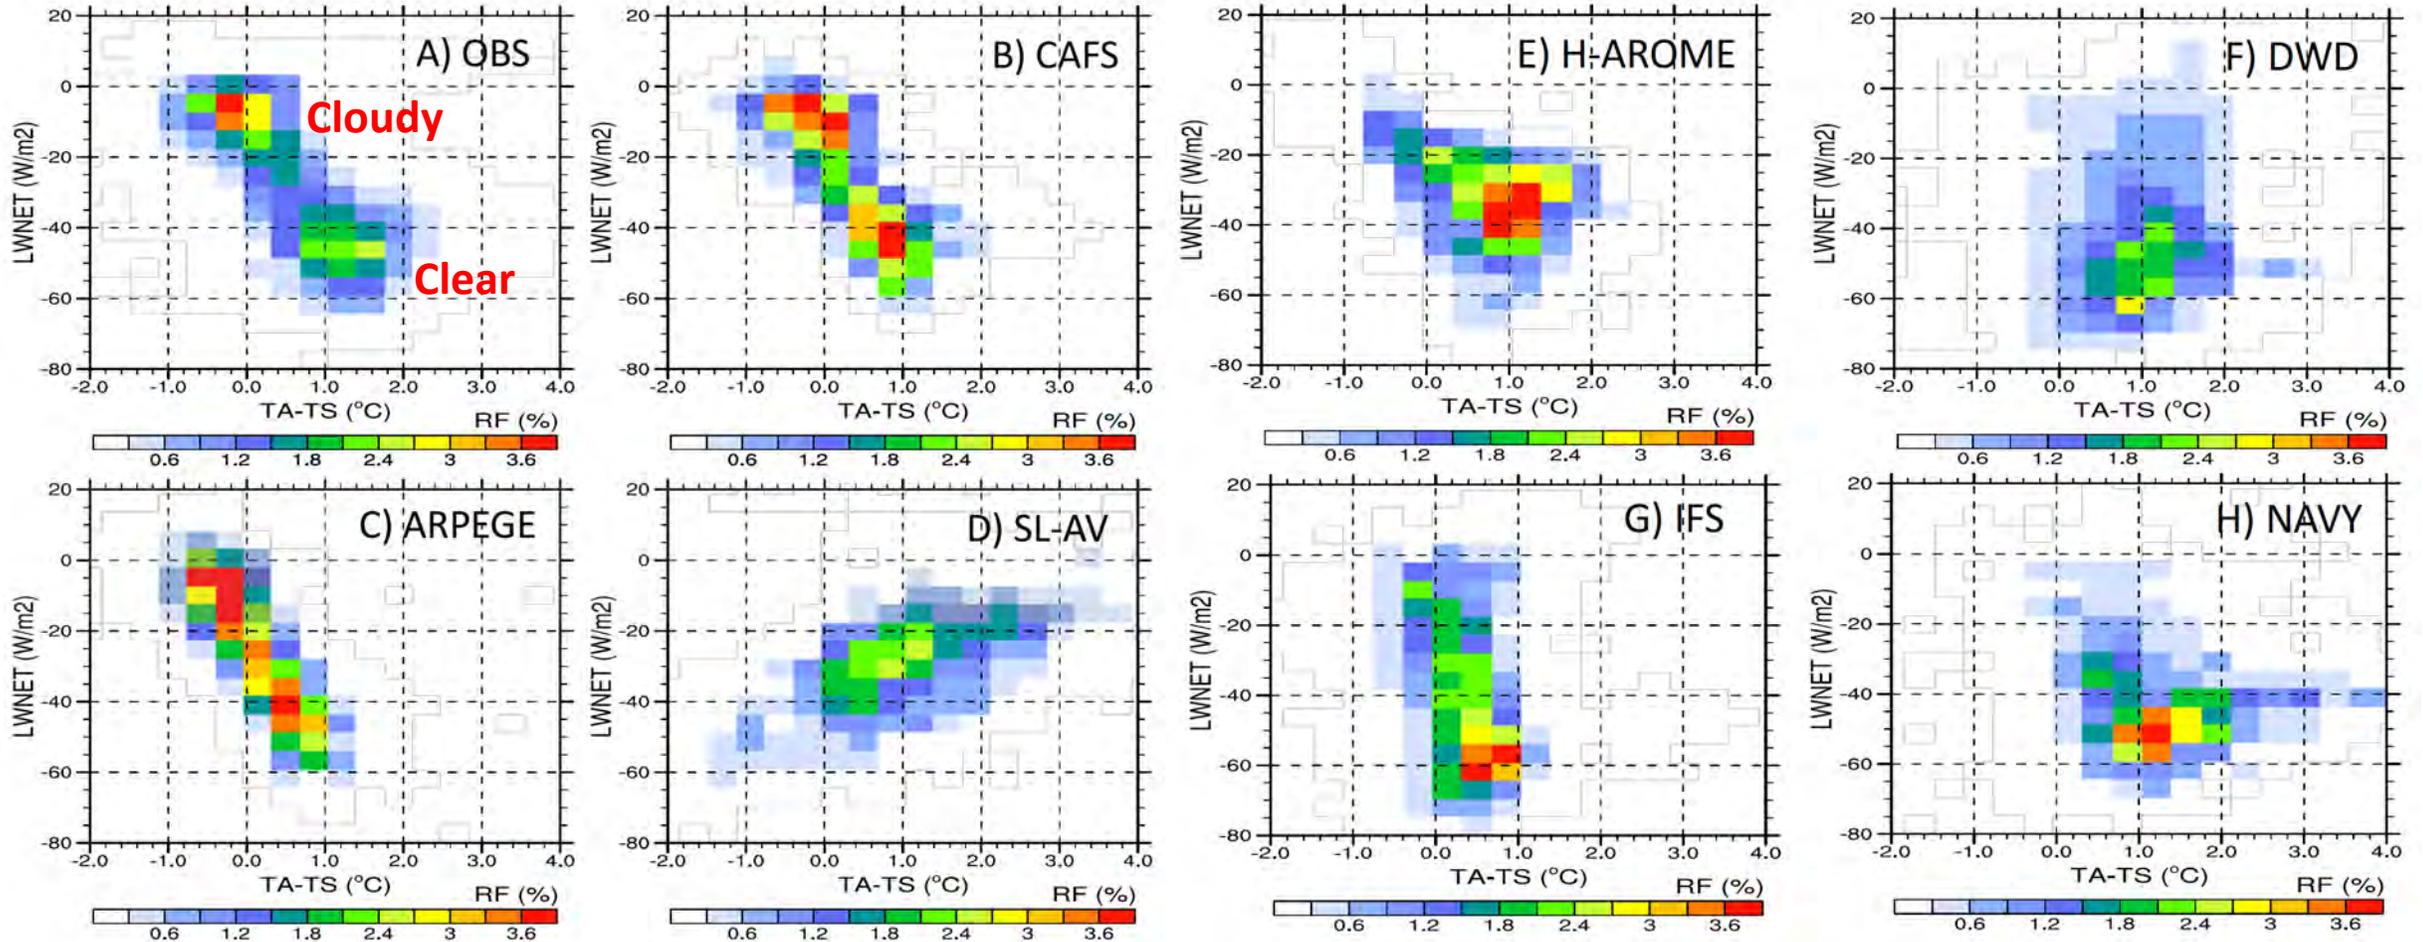

- 5-day back trajectories for liquid clouds
- Cluster based on time since open water, ice concentration, change in moisture, etc. along trajectory
- Provides insight into cloud formations mechanisms and pathways

Process-based Model Evaluation

Net LW vs T2m-Tsfc

Amy Solomon

- Cloudy sky mode often missing or poorly represented
- Near surface stratification often too weak
- Can examine many other “process relationships”

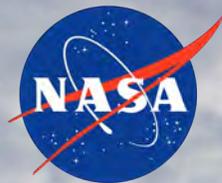

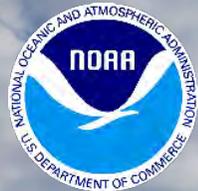

Summary

- Many challenges that brought opportunities to engage the emerging Arctic
- Thin, dynamic sea ice! We were in the middle of it.
- Tons of science! Accomplished as much as possible
- DOE showed important leadership
- Broad participation: International, interdisciplinary
- Capacity building: New generation of trained field scientists; new concepts for research on thin ice
- Legacy of Data for all to use (Fully avail. 1/2023)
- ARM data and PI Products available!
- So much science to accomplish.... Please engage!

2nd International
MOSAiC Science Conference

13-17 February 2023 Boulder, CO

<https://mosaic.colorado.edu/second-science-conference>

You are invited!
